"What is keeping back housing at the present time is the fact that there are not enough skilled men to do even a quarter of the work wanted. The trades unions will not allow the number to be incrased from the outside. The government isusing a sort of indirect compulsion by prohibiting luxury and unessential building, so that if a man will not build cottages he is not alloed to build anything else. There arc various suggestions for speeding up the work, including a guarantee to the trade unions of employment for a term of years to men employed on housing work, to insure them against loss of time in bad weather by a minimum wage, wet or dry.' In return the trades unions will be asked to consent to dilution and the employment of unskilled labor, to give up their appreciceship rules, and to abandon all opposition to the employment of ex-service men, trained or untrained. There are 'luxury building' tribunals to hear appeals against decisions prohibiting buildings regarded as non-essential.

"There are housing bond campaigns all over the country. In London subscritions to the 6 per cent. bonds are coming in at about the rate of £100,000 a day. While the local governments are isuing 6 per cent. bonds, the British Government charges 7 per cent. Borrowing in the ordinary way for housing schemes not financed by bonds is usually 7 per cent.

"The total number of housing schemes in England and Wales numbers more than 10,000, covering in all land for 800,000 houses. Of these some 7,000 have been approved, with an area for 550,000 houses. In Scotland 103,000 houses have been authorized, the bids averaging £1,000 per house. This is roughly £100 to £150 more than it costs per house in England."

The Housing Problem in Bulgaria

In order to alleviate the congestion in Sofia, the committee in charge of the new projects has decided to convert all the big cafes and taverns into ordinary dwelling places or Government buildings. Rents have increased by between 150 and 200 per cent., according to the Near East. The compulsory construction of new houses is contemplated. All the banks, joint-stock companies, and rich people from the interior Provinces wishing to live in Sofia are obliged to build their own houses.

THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use

Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

To Do Small Work on Big Machines is as clumsy

and inefficient as trying to drive a ten penny nail with a sledge hammer. It can be done, of course, but how tediously a man must work and because it is tedious, it is therefore slow, hazardous and mighty costly for you.

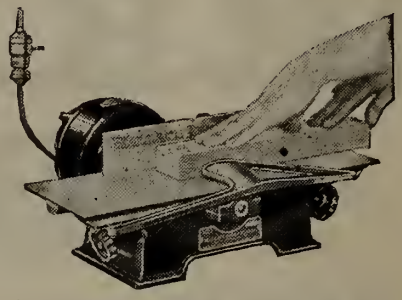
Think it over—it is a new thought and when one is accustomed to doing a thing one way, it is not very easy to see it another, But try sawing, trimming or jointing or any of the operations in cabinet, pattern or assembling work on big machines. You are very careful and always apprehensive.

If you had a smaller machine, the Wallace Bench Planer, or Jointer or Saw, you would run this stock over in a jiffy and be done in half the time.

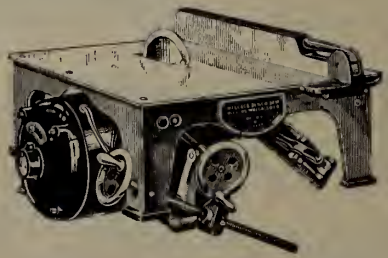
Then too, besides this decided time saving advantage of using Wallace Bench type machines for bench work, you profit by other advantages, i.e., you can take these Wallace Bench Machines to the work—they are portable. They set on the bench or along the side of it and at the elbow of the workmen, thus they save many time consuming trips to the big machines and so handy the men do little, if any, hand sawing or planing.

No wonder over 10,500 Wallace Bench Planers, Jointers and Saws are in daily use. You will find them at every bench in many pattern or cabinet and carpenter shops and in production work in plants.

Investigate the Wallace Idea for we know it will pay you. Ask any high class machinery dealer—phone or write us.



THE WALLACE BENCH PLANER or JOINTER (4 in. or 6 in.)



THE WALLACE BENCH SAW (Universal or Plain)

adopt the WALLACE IDEA at every bench

ASK YOUR MACHINERY DEALER

Wallace Bench Machines are sold by regular dealers who have anticipated your requirements — they are familiar with the performance of these machines now in use and their advice is therefore based on actual experience.

Our regular dealers have machines available to demonstrate the adaptability of the Wallace Idea to the various operations you have in mind and they are in a position to make prompt delivery from stock. They carry a full line of repair parts and instructions.

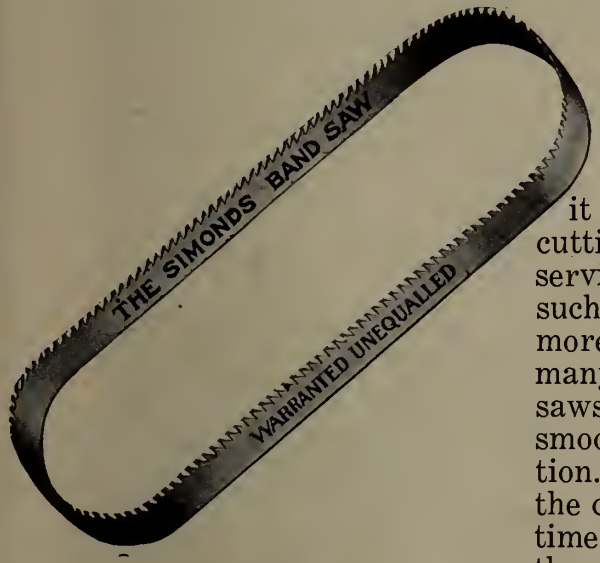
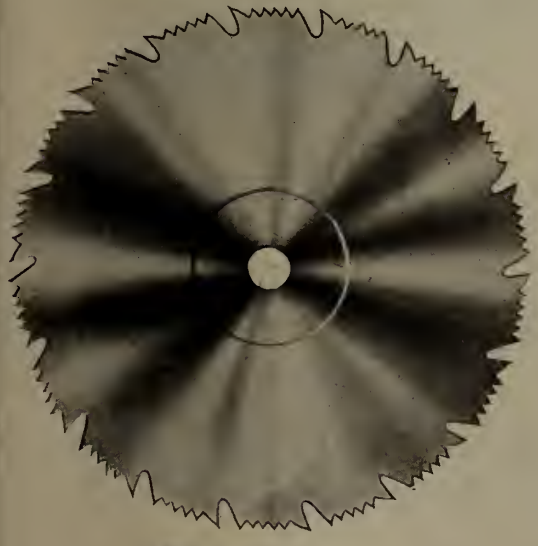
SIMONDS
SAWS AND KNIVES



For mill or woodworking shop it pays to use the better grade of cutting tools because of economy and service. The best saws and knives, such as Simonds, may cost a little more, but in the long run they are many times more serviceable. Good saws and knives mean better and smoother work and greater production. In other words, they reduce the cost of cutting and eliminate lost time for repairs which is too often the case when inferior grades of saws and knives are used.



If you want the best of the good saws write to us about any style or size. Remember we make Grooving Saws, Novelty Saws, Narrow and Wide Band Saws, Web and Scroll Saws, Swage Saw Sets and Machine Knives for all purposes. Let us send you a copy of our catalog describing the complete line we manufacture.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

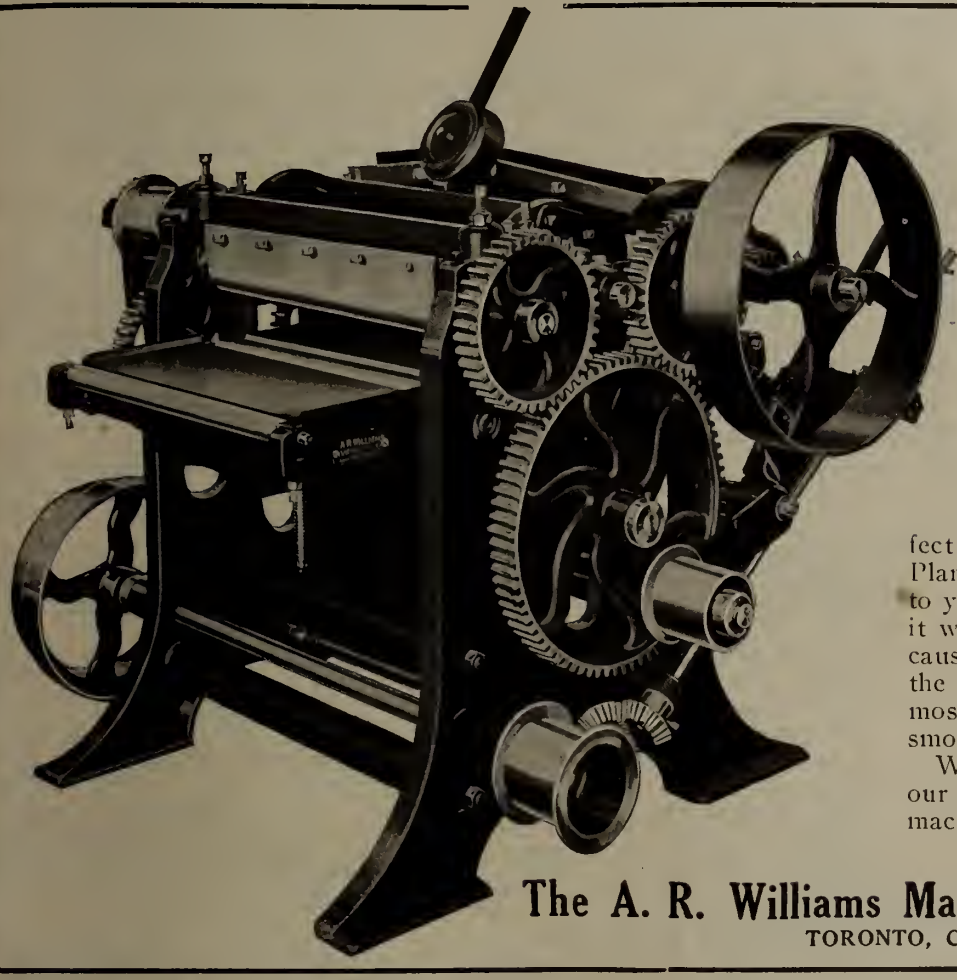
St. Catharines, Ont.

Eastern Sales Offices:
Hall Machinery Co., Sherbrooke Que., and Birk's Bldg., Montreal.

What other representative manufacturers are doing is of interest. And that interest is the basis of a new service. Its purpose is to acquaint the manufacturer with the ideas of firms in his own line. And best of all, it does so by means of actual sketches, showing in a way that makes it clear without the use of an unusual amount of imagination. You see their ideas as to the layout of their plants as they are in actual operation today. It covers different kinds of plants and small ones as well as large ones so that the lessons can be applied to your own situation. For example, the use of storage tracks for holding green lumber before it goes into the kilns, avoiding rehandling, is an important development in many plants And the location of the kilns with regard to the doors, saws, etc., is worth considering. Even before you make any decision of choice of kilns, this service furnished by an experienced engineering department is available. And of course, without obligation. It is our method of advertising and of demonstrating service. We will gladly send you interesting and representative layouts to use in studying up on your own kiln question. Address: The Standard Dry Kiln Co. 1542 McCarty St., Indianapolis, Indiana.



A Record Service by

The "Eclipse"

SURFACE PLANER

With a record of over 2,000 in actual use and giving full satisfaction and perfect results the "Eclipse" Surface Planer is bound to be of interest to you. For the furniture factory it would be an ideal machine because of its ability to produce the highest grade of planing and most suitable where very thin, smooth work is required.

Write us for full particulars on our entire line of woodworking machinery of all descriptions.

Basswood

1 in., 1¼ in., and 1½ in. Dry Basswood

Dry Birch Stock

We offer in **Birch** and **Maple**
End Stock 1 x 7 in., and wider, 1 x 6 in.

All thicknesses and grades in
MAPLE, BIRCH, ELM, BASSWOOD and BROWN ASH

Spruce, Hemlock and Pine

Can saw to order at MacDonald's Siding and Powassan

Let us Quote on Your Requirements

Hart & McDonagh

Rooms 7 and 8 Robinette Chambers
Cor Bay and Temperance Streets
TORONTO

THE GALL LUMBER CO.
Established 1898 Limited
Wholesale Dealers in Foreign and Domestic

Hardwoods

Offices, Dry Kilns, Warehouses and Sorting Yards.
Lake Street, Foot of Spadina Avenue
TORONTO, CANADA

The Door Carrier System

Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.
Ask for catalogue.

DRY KILN DOOR CARRIER CO.
1117 Cornell Ave.
INDIANAPOLIS, IND.

Do Not Gamble on Your Veneer Tapes

BUY THE BEST.

Ideal Veneer Tapes

The material with the guarantee behind it

Profit by our many years' careful application to the subject of Veneer Tapes.

We have several qualities, cloth and paper, plain and perforated, which will cover all of your requirements.

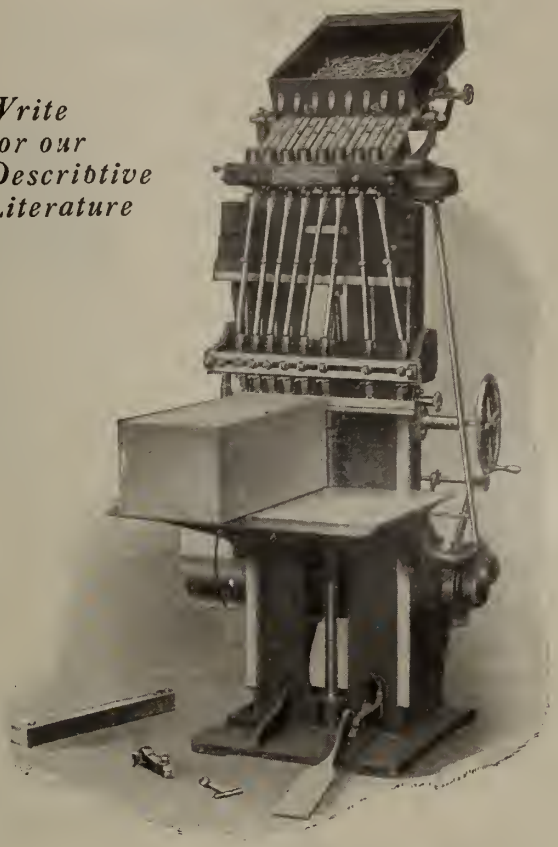
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

You Can Use This to Advantage

The Olson Frame Extension

Increase the carrying capacity and therefore the usefullness of your Ford Truck by the addition of the Olson Frame Extension.

Particularly adaptable for the transportation of lumber and furniture for either short or long distances.

The perfect balance of the Olson makes smooth and easy running—a desirable feature when easily broken articles are being carried.

Our nearest branch will be pleased to send you fullest information.

Brand New, at

One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

We have in Cincinnati, available at once, three Whitney 30-in. single surfacers and two Whitney 30-in. double surfacers, all with sectional rolls; three double arbor revolving saw tables; three single arbor tilting table saw benches; F.&E. single-end tenoner with roller table, and a few other choice machines. All are in exceptionally fine condition—are doing precision work at the present time.

7 New Hermance Molders, 8, 10 and 12-in., Stationary and slip-on heads.
8 New Andrew Multiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Door clamp, Fay-Egan, heavy.
Door clamp, Jenkins-Hayes power-feed.
Edgers, two, three and four saws.
Glue cookers and retainers.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Lathes, speed, eight, mounted on iron bed.
Lathes, turning automatic, Mattison No. 8
Yates No. 72, practically new.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, 24x6-in., 3 and 4 sides.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan, 12-in. outside, heavy.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type; Greenlee vertical, double hollow-chisel.
Nailers, two, Hayes, 8-track, 8d, closed back.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread, Hayes' make.
Pony planers, 16, 20 and 24-in.
Rip saws, self-feed, Hoosier, F. & E. Greenlee.
Rip saw, gang, Luther, for box work.
Router for stair stringers.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30- 42 and 54-in. Columbia; 30, 42 and 48-in. Invincible; 30 and 36-in. F. & E. double.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Shaper, Whitney No. 7 and 8 double-spindle, practically new.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, Fay & Egan double-end, also single-end.
Window frame machine for production work, new.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

We have just received two carloads of Band Saws and Jointers—all new—which are ready for immediate delivery.
Band Saws, 20, 26, 32, 36 and 38-in. Jointers, 8, 12, 16 and 24-in.

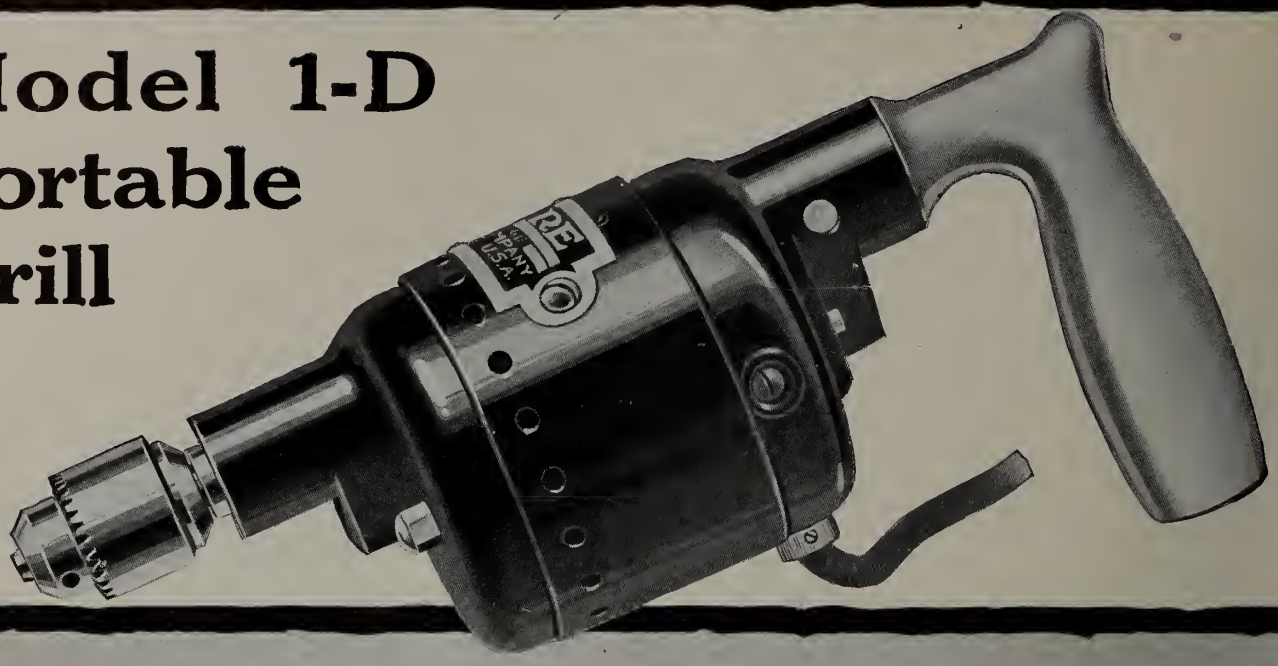
Vol. XX Toronto, November, 1920 No. 11

Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{13}{64}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{33}{64}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

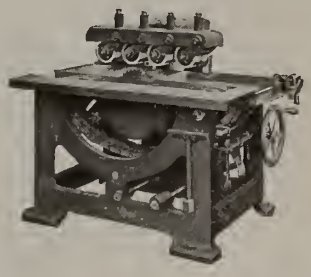
DUMORE GEARED ELECTRIC DRILLS

The Best Woodworking Machines

No. 30 American Universal Saw Table for ripping, cross-cutting, mitreing and dadoing. It is a double arbor machine, carrying both rip and cross cut saws. It will fill your requirements for an accurate and versatile machine that can be quickly set up for different operations.

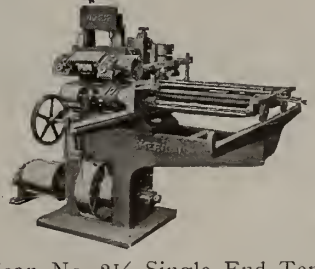
American No. 200 Automatic Self-Feed Knife Grinder. A universal machine that will grind either thick or thin knives. Made in two sizes 31 inch and 37 inch.



American No. 25 Power Feed Edging and Ripping Saw. Perfectly straight joints can be made on this machine and it will rip stock as short as 5 inches. Ask us for the names of furniture manufacturers using this machine; then ask them what they think of it.

American 36" Single Cabinet Surfacer fitted with sectional roll and chipbreaker. Cut shows machine with direct connected motor but the machine we have in stock is for belt drive We will be pleased to set this machine up under belt for your inspection.

Above illustration shows American Hand Feed Jointer. We have a 30 inch machine of this type, fitted with power feed attachment. Just the machine for facing your lumber preparatory to surfacing.



American No. 2½ Single End Tenoning Machine. Will cut a tenon 3⅞" at one operation. Any thickness of tenon can be cut on stock up to 5¼" thick and 15 inches wide.

The above are a few machines selected from the stock in our Toronto warehouse.

We have a large and varied stock of new and used woodworking machines and take this opportunity of inviting your inspection of them.

Write us about your machinery problems—Our experience may be of benefit to you.

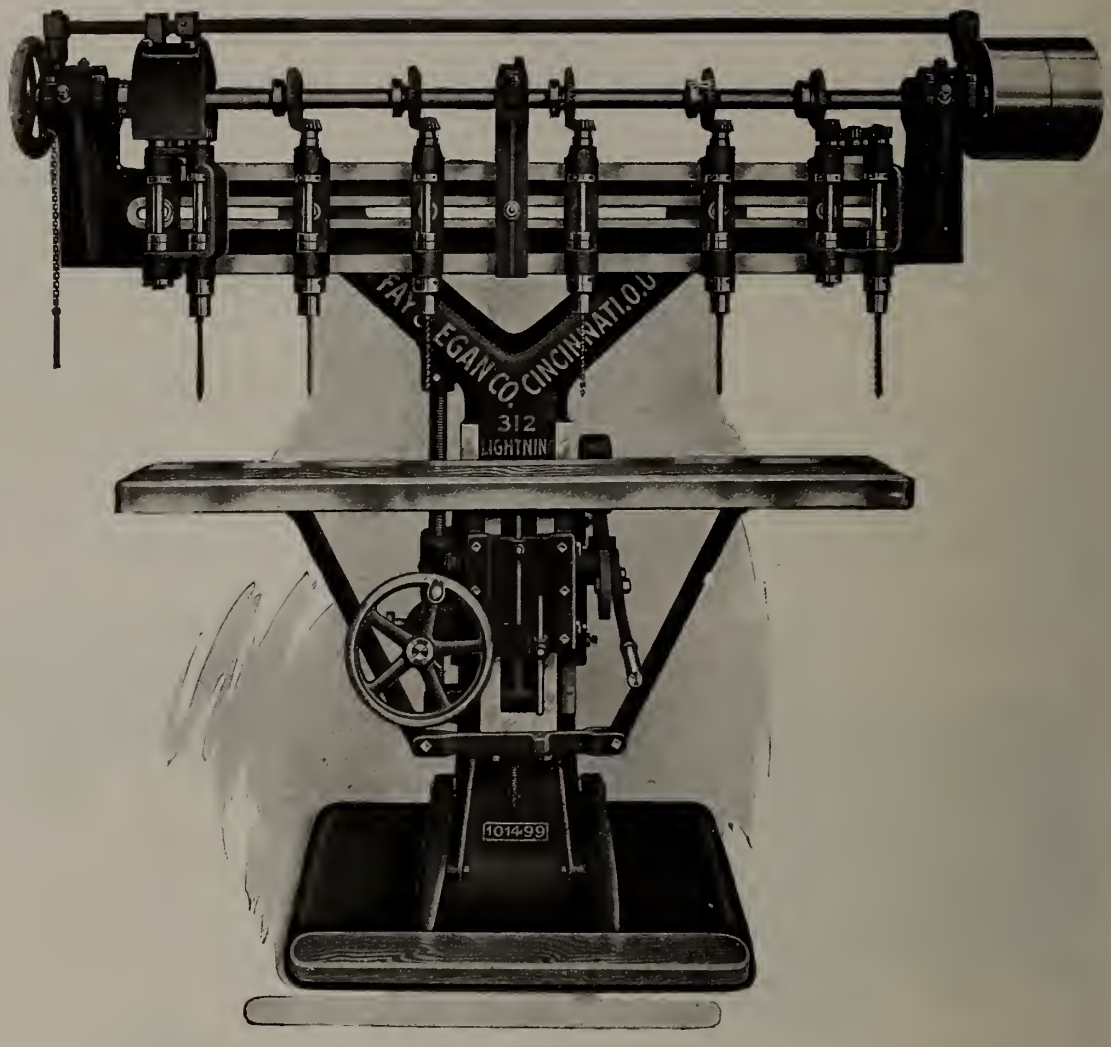
WINNIPEG TORONTO MONTREAL

Everything in Woodworking and Metal Working Machinery

DO YOUR BORING ON A



No. 312 "Lightning" Multiple Spindle Borer

Designed for use in car-shops, arsenals, agricultural implement and ordnance works, wagon, toy and furniture factories. Extensively used in air-craft factories for boring tightening and stringer holes in wing webs, and for boring metal fittings.

No. 312 will bore twenty or more holes of different sizes, either in a straight line or staggered, in the time usually taken to mark off and bore one hole. All holes are bored at one stroke at the table and every piece is an exact duplicate of all others. No laying or marking off required. This is a modern, high efficiency tool which will greatly reduce the cost of doing this class of work.

No. 312 saves time—labor—power and money wherever used.

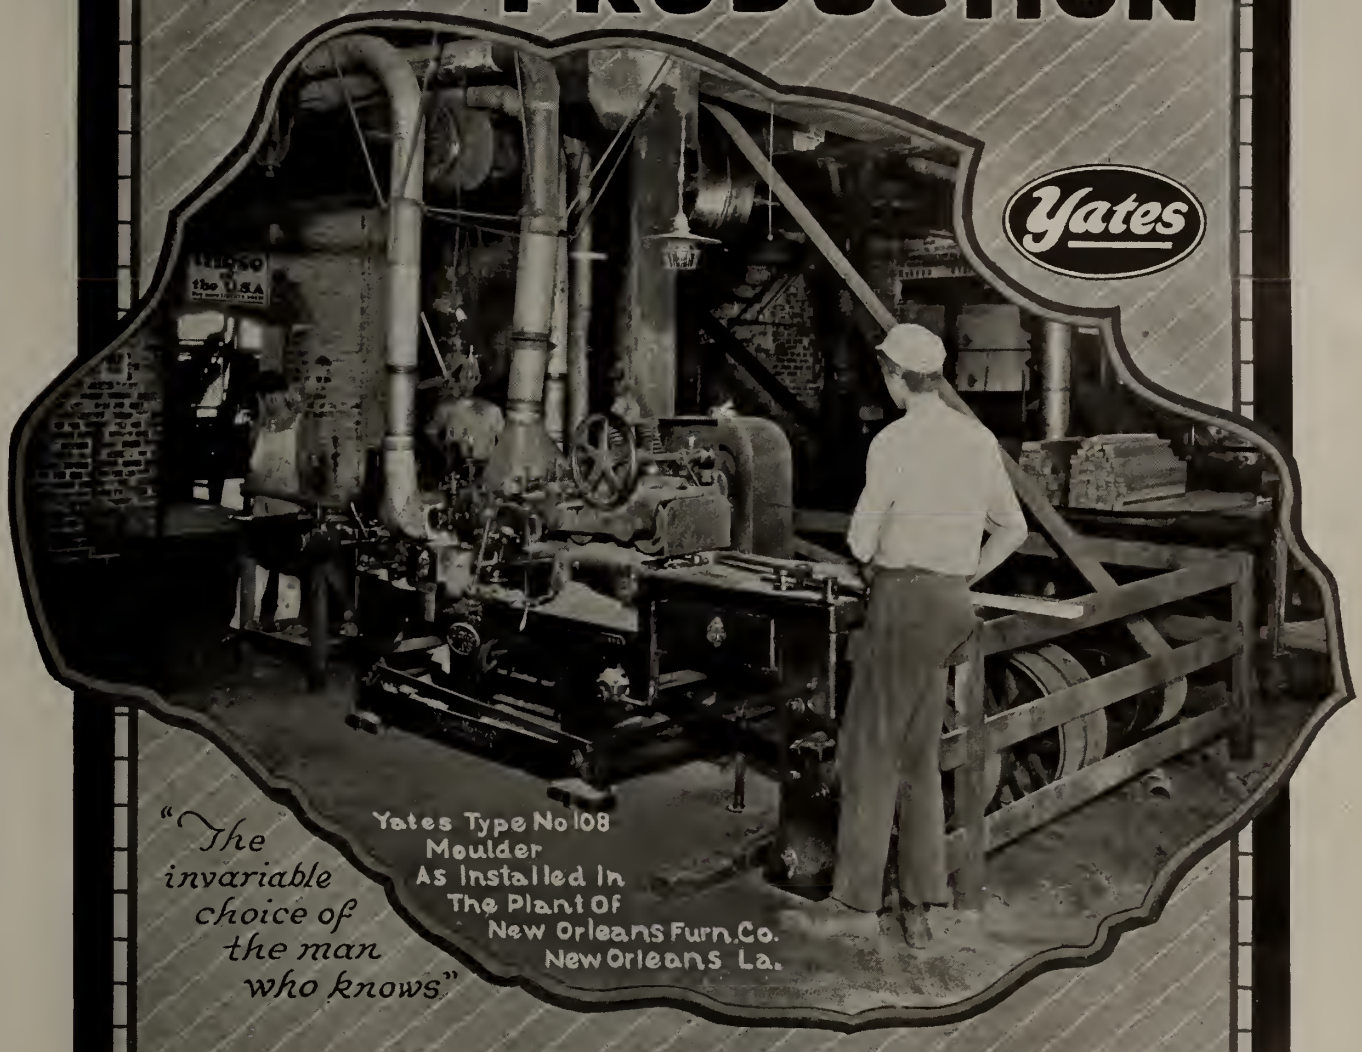
LESS MEN, MORE PRODUCTION



Yates
"The invariable choice of the man who knows"
Yates Type No 108 Moulder As Installed In The Plant Of New Orleans Furn. Co. New Orleans La.

The Yates No. 108 Moulder

is built for strength and speed and it sure does get the work out. Is just the machine progressive mill men are looking for. They cannot afford to be without a No. 108. This is the big reason. By actual tests, in many mills, under all conditions, the Yates No. 108 got out more mouldings and better mouldings with less men. Write a letter for detailed information and circulars.

P. B. Yates Machine Co. Ltd.,

U. S. Plant - Beloit, Wis.

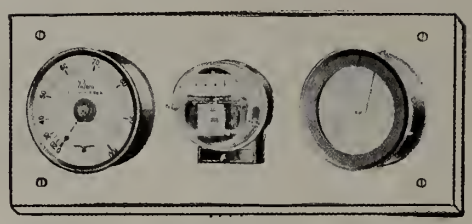
Republic
TWINS

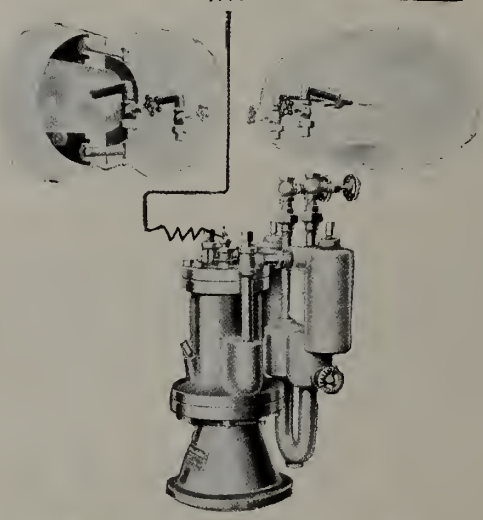
Trading Flow Meters for Boilers

BY installing Republic Flow Meters on a battery of six boilers, a well-known traction company avoided ordering two additional boilers to take care of its peak load. Not only was the cost of the boilers avoided, but also the continual expense of keeping additional boilers banked under light load during the off-peak part of the day. This Company traded Flow Meters for boilers at a tremendous profit.

When you consider that a saving like this is merely incidental to the many economies brought about by tracing erroneous conditions during the regular operations of the boiler room, you begin to realize how really indispensable an installation of Republic Flow Meters IS.

In every-day operation the Republic is a constant guide to furnace efficiency—a continual indication of the performance of individual boilers—an indisputable record of power costs by Departments.





Trading CO_2 Recorders for COAL

COMBUSTNON means a combination of carbon with the correct amount of air. If too much air is admitted the coal is wasted. The only method of checking continuously and correctly is by the use of a CO_2 Recorder. If a CO_2 Recorders is installed, the amount of air cut down, then the amount of coal is lessened; in fact, you have traded CO_2 Recorder for coal.

With coal at the prevailing prices, a CO_2 Recorder is a very good investment under such conditions.

Also by the use of a CO_2 Recorder **Black Smoke is avoided.**

Republic CO_2 Recorders have no valves, no glass (tubing or otherwise), only two moving elements, no complication of mixtures, absolute absorption insured by long travel of gases through absorbent.

The "Shimer Limited" Expansion Head

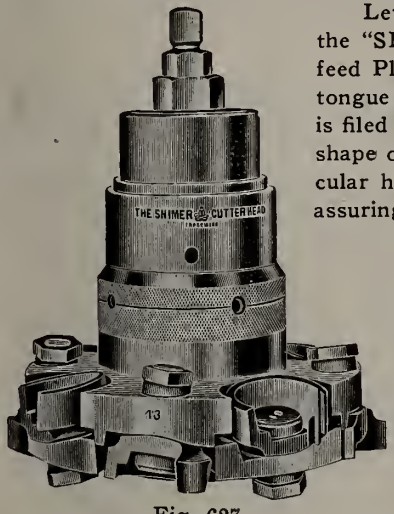

Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

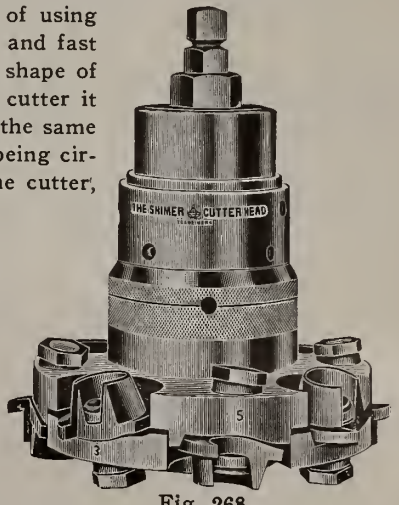

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

Your High Class Machinery Needs High Quality Belting

THE finest of machinery cannot do itself justice when equipped with inferior belting. Neither can it function as profitably for its owner; there is something essential that is lacking. But fine machinery equipped with a really efficient belting! Here you have a team that is unbeatable.

Woodworkers have been quick to realize this truth, and quick to apply it too—hence the extensive use of "CROWN PLANER."

Become acquainted with "CROWN PLANER" now, every day that passes means an actual loss in time and money. A word from you will bring immediately full information.

Sadler & Haworth

What Belting are you using on your Planers?

The owner of the machine shown here has adopted "Crown" Planer Belting, because he knew the service tension under which it would have to work — reliability was essential.

Did you know that sometimes too high grades, and too expensive belts are used; sometimes a heavy belt is purchased when a lighter one would answer the purpose; sometimes a double belt is put on the pulleys when a single belt would be better. These however are rare exceptions, more frequently the belting is of too low a grade, or a single is used where a double or its equivalent would be better and far more economical. Another frequent fault is the use of too narrow belting. It is good judgment to use just as wide a belt as possible. But whatever your problems remember that we are always ready to help you solve them. Do not hesitate to ask our assistance.

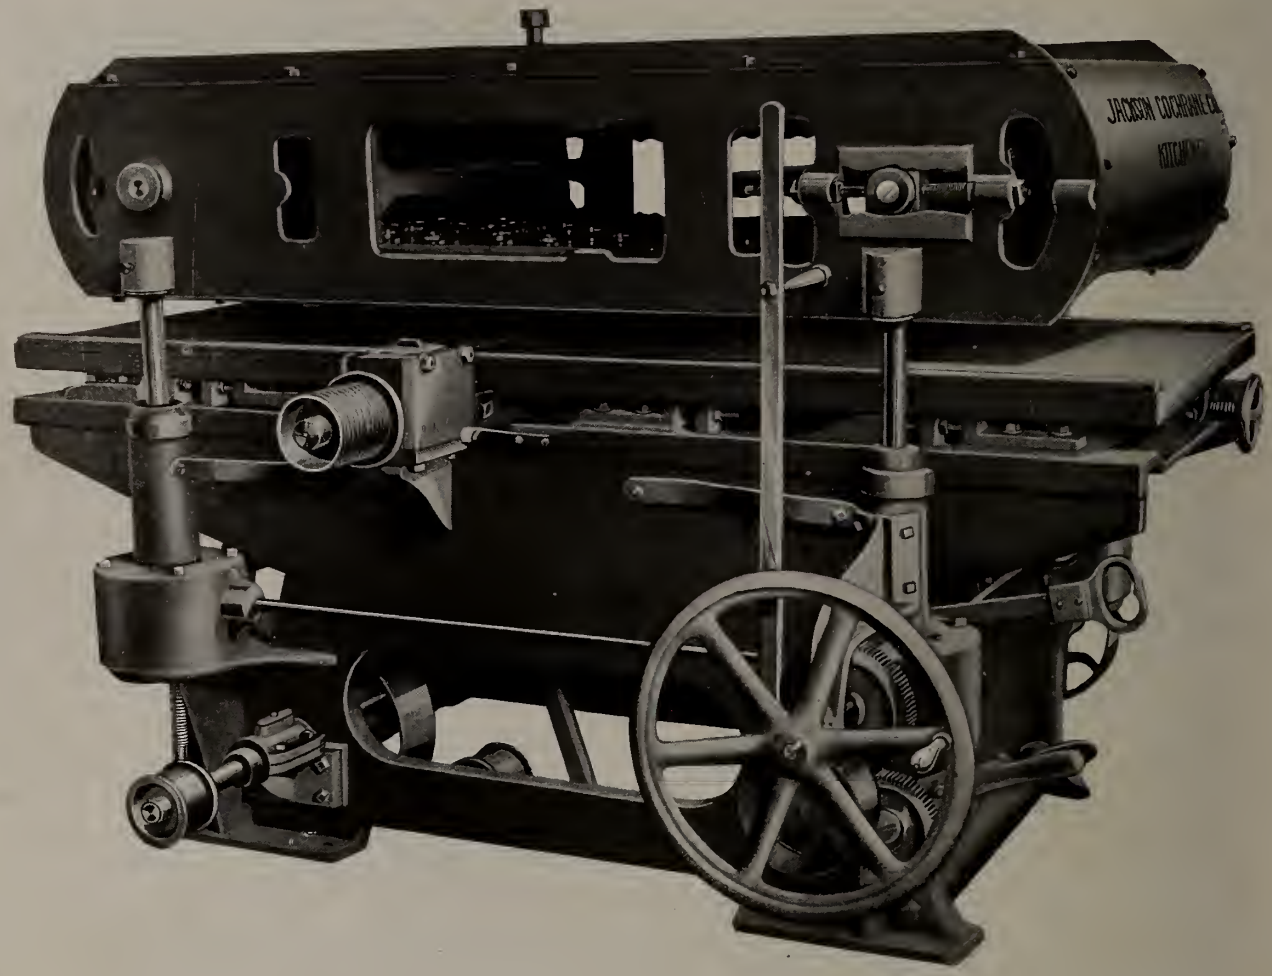
Herzog Self-Feed Jointer



Two Boys Could Operate This Jointer for You

Think what a saving that would effect in your shop—two boys doing the work—better—and from three to five times faster than hand jointers. Such efficiency is made possible by the many splendid qualities the machine possesses, its simplicity of operation, its ruggedness of construction and its ability to work at high pressure without frequent breakdowns.

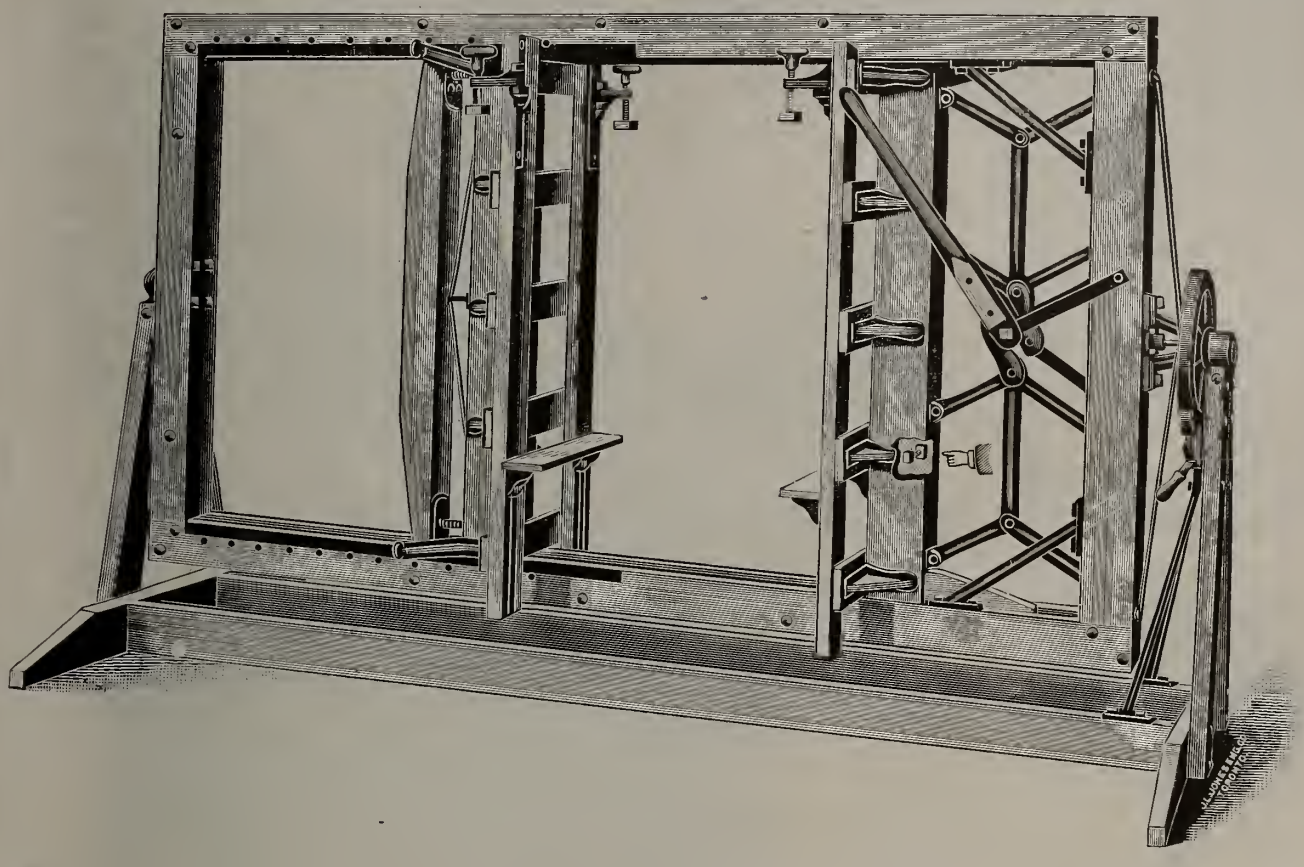
The Herzog Self-Feed Jointer handles stock varying in width from 1 inch to the full width of the machine. It will operate at fast or slow speeds while the knives require about one-fifth the attention given hand jointers.

We would like to send you full particulars and prices. May we?

Jackson, Cochrane & Company

KITCHENER - CANADA

No. 190 Improved Revolving Case Clamp



For Greater Production Install This Machine

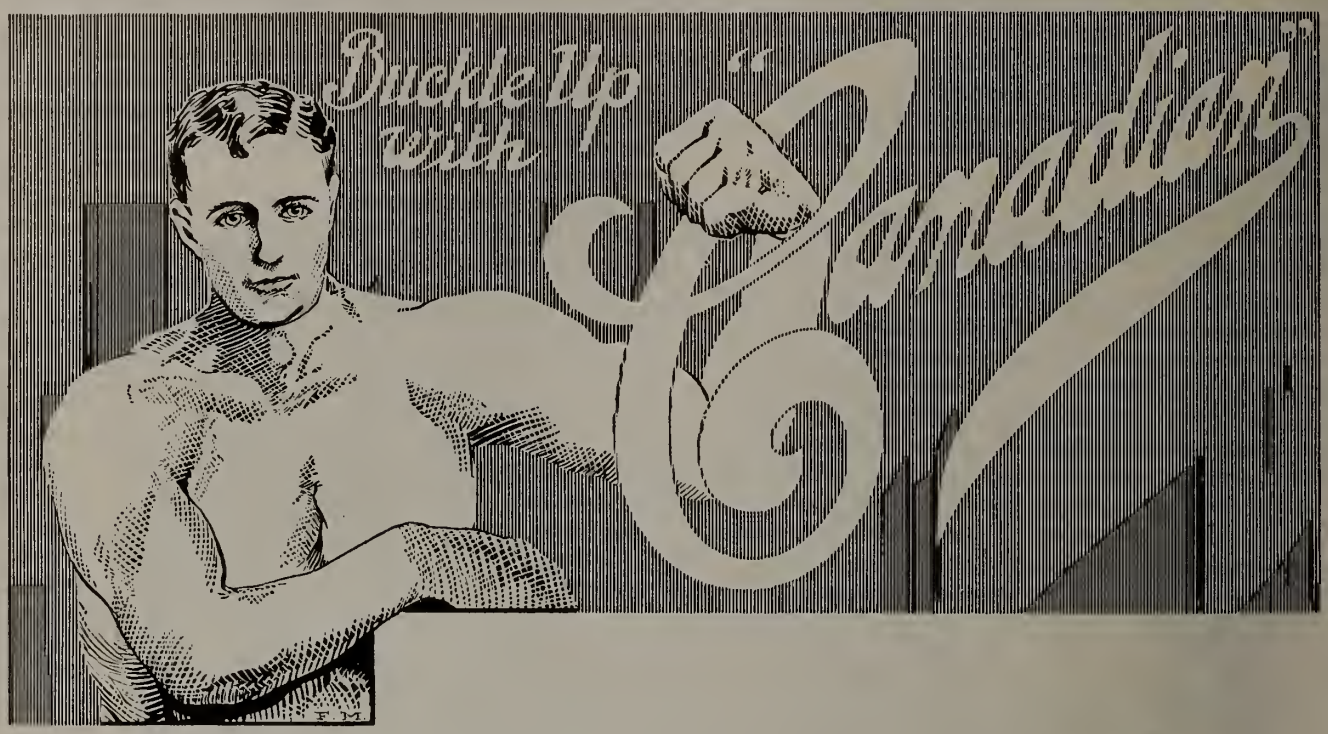
In the manufacture of dressers, bureaus, wash stands, phonographs, etc., the machine shown above proves invaluable. It is operated entirely by one man and eliminates all unnecessary handling of the work. The clamp accommodates a wide range of sizes as one end is moveable to any position while the other end has sufficient movement to allow the case to be tightly clamped. As will be seen in the illustration this is accomplished by means of the large lever shown at the right.

The clamp will not spring, neither does it have to be released before revolving, and the workman can get at all parts of his case while standing in front of the machine.

We can supply this machine in two sizes 50 inches high by 5 feet wide and 72 inches high by 5 feet wide. Fullest particulars gladly sent on request.

Jackson, Cochrane & Company

KITCHENER - CANADA



A blacksmith or wheelwright who is equipped with efficient, accurate and serviceable tools like the CANADIAN not only can do better work but much faster and with the least possible effort

Blacksmiths and wheelwrights are mechanics—they must have the best tools and equipment. Their work demands them.

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

Engineers in Every Industrial Country Endorse Goodyear Belting

INDUSTRY of other countries approves the economical and satisfactory power transmission which Goodyear Belting is rendering daily throughout Canada.

In the factories and mines of South Africa, the workshops of India and the Orient, the mines of Australia; in industries throughout the world, Goodyear Belting is daily solving power problems. Every obstacle overcome teaches us something more about the efficient specification of the proper belt for each drive Men all over the world who have problems similar to yours will now contribute their experience to the fund of knowledge possessed by the Goodyear belting man who calls on you.

To meet the conditions of this world-wide trade, it has been necessary to change some of the brand names of Goodyear Belts.

For instance, Goodyear Extra Power is now Goodyear Klingtite Belt.

But the change is in name only. Goodyear Klingtite Belt is the old Extra Power in every particular.

Any Goodyear branch will send a man who has studied power transmission problem solved by the use of Goodyear Belting the world over—who will br ng this knowledge to bear in solving yours.

No obligation. Phone, wire or write the nearest branch

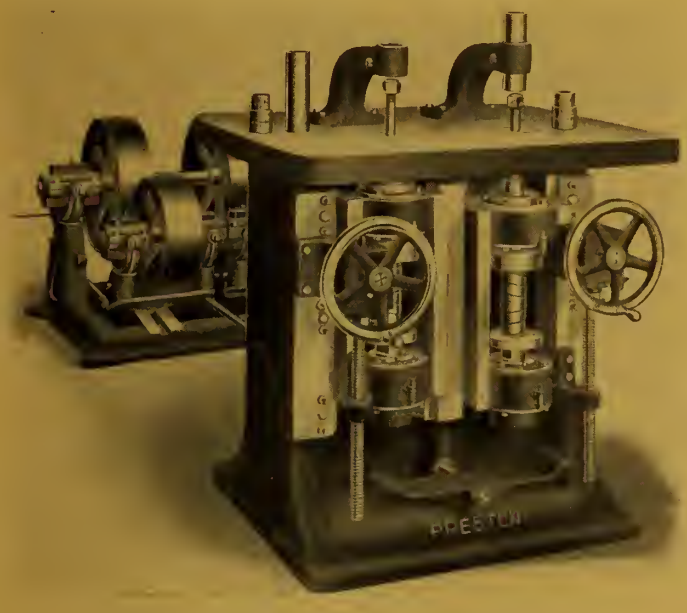
MADE IN CANADA

KLINGTITE GLIDE BLUE-STREAK

Just on the Market

Designed for Quantity Production

This "PRESTON" High Speed Shaper was designed primarily for the quantity production of small pieces such as brush handles, plane handles, saw handles, or any other small work.



Preston high speed shaper for quantity production

It is designed to run at the unusually high speed of 11,000 R.P.M. This speed not only materially increases the productive capacity of the machine, but enables it to turn out very smooth work, so smooth that little or no sanding is required.

LET US SEND YOU SAMPLES

This shaper is made with 12, 14 or 19 in. spindle centres or may be had with any centre to suit the requirements of the user. The brackets shown behind the spindles carry form guide collars. The ordinary form is used and is worked against these guide collars which do not revolve. This eliminates the necessity of working the form against the spindle and also does away with all friction, thus tending for better work.

The bearings in this machine are all S.K.F., including ball bearings in the loose pulley on the countershaft.

We can supply Single Spindle Shapers and Double Spindle Shapers of any size or weight required.

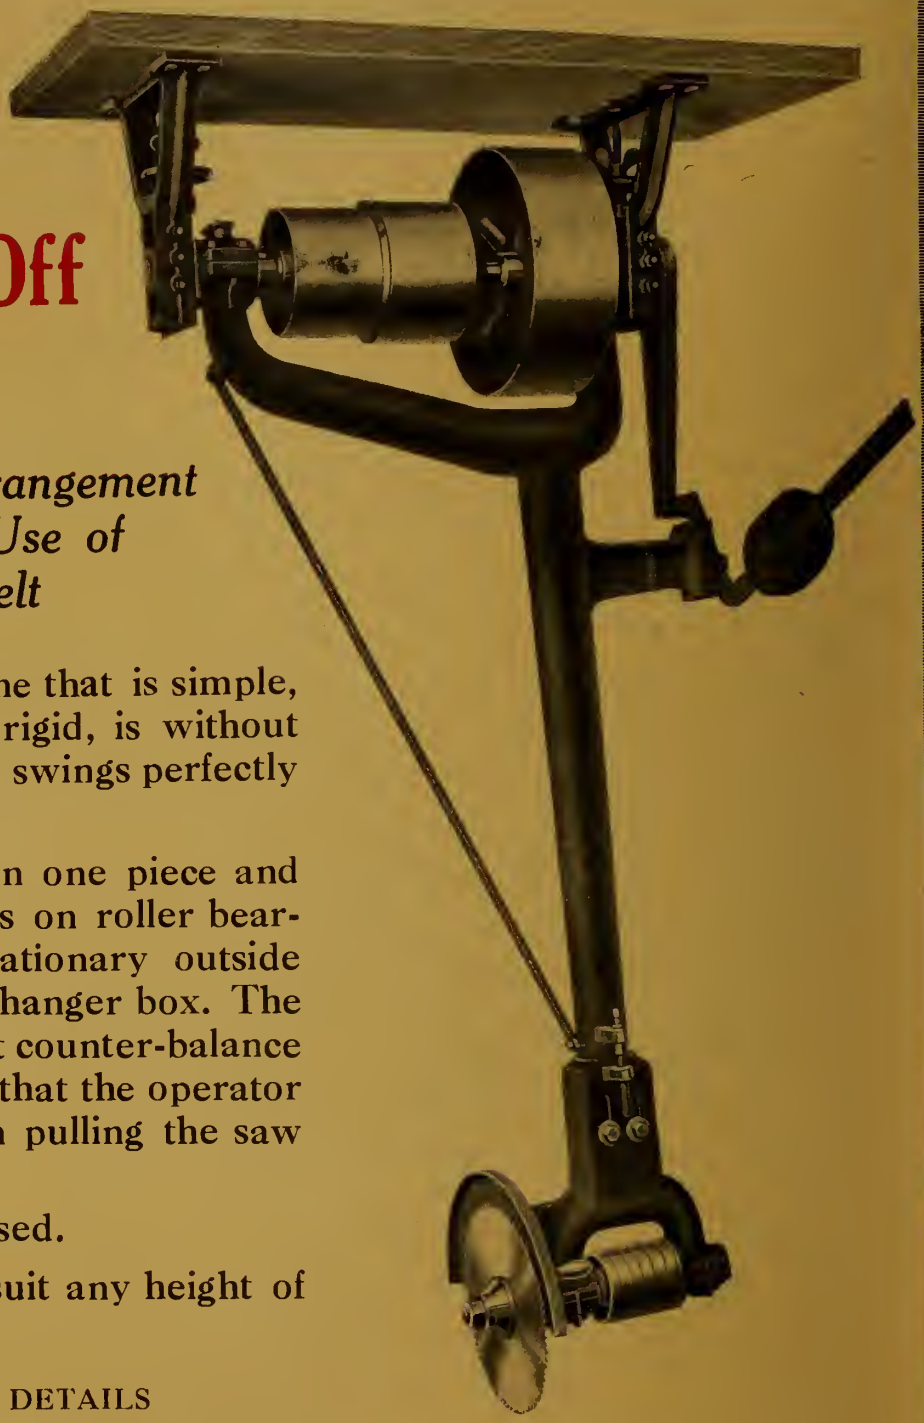
No. 152 "PRESTON" Swing Cut Off Saw

With Special Arrangement Providing for Use of Endless Belt



A "Preston" machine that is simple, practical, absolutely rigid, is without vibration, and always swings perfectly true.

The column is cast in one piece and cored out. It swings on roller bearings on a solid, stationary outside section of the square hanger box. The machine has a perfect counter-balance which is so arranged that the operator is actually assisted in pulling the saw through the lumber.

The endless belt is used.

Machine is built to suit any height of ceiling.

WRITE FOR DETAILS

The Elliot Bull Dog Planer

The illustration shows our new 16" x 6" Planer.

This Planer will fill a long felt want for a machine that will run from a 1½ or 2 H.P. Motor. It can be run from the Motor on an ELLIOT WOODWORKER, or from any other power by the addition of a counter-shaft.

We have eliminated all cut gears with which all other Planers are equipped, and drive the feed rollers with a worm gear thereby saving power.

This machine will do fine work and will soon pay for installation.

Write for prices and terms.

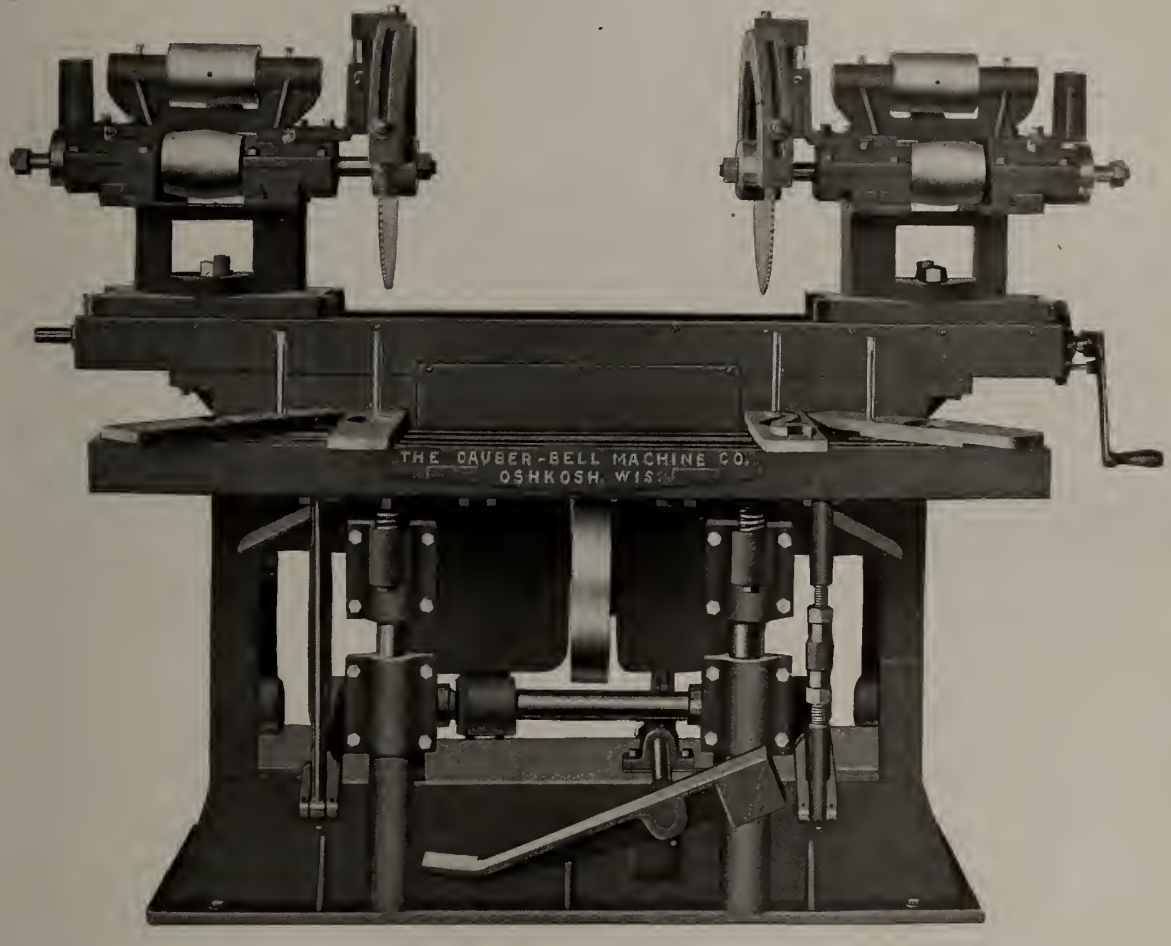
BELLEVILLE · ONTARIO

The "BELL" Double Cut-off Saw

For Square or Angled Work



This machine cuts both ends of work whether it be square, simple or compound angles. A wonderful labor saver for furniture, chair, refrigerator, casket, wheel, auto body, airplane, phonograph cabinet and other work.

Furnished with belt drive or direct connected motor drive.

Increases speed of production and gives absolute accuracy.

The saws can be swivelled to any angle and the table is power driven. Can be used for notching and gaining as well as cut-off work, as the arbors are suitable for dado heads as well as saws.

The Dauber-Bell Machine Co.

OSHKOSH, WISCONSIN

What does SKF mean?

TO say that S K F denotes a standard of quality in a ball bearing is to recount that which has been proven and obvious for years.

To even say that S K F is a mark denoting a *kind* of bearing, is to omit its more important significance.

For years this S K F mark has been the device of a business, pioneering in all fields of industry, championing the application of the ball bearing to mechanical design.

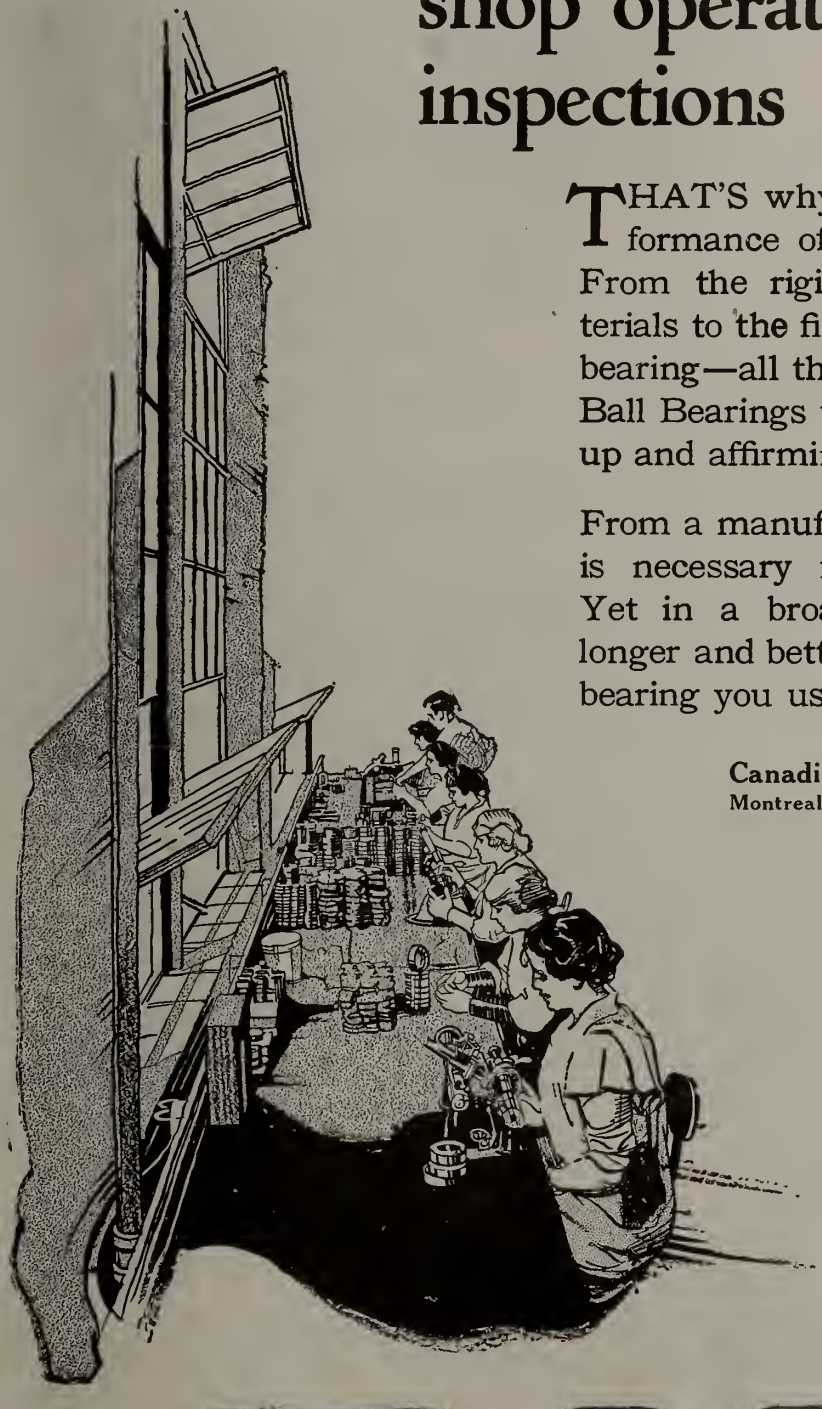
So that to the extent that it has overcome precedent in machine design, or upset traditions in bearing practice, S K F means more than a kind or type of bearing: it is a brand of service—working in the cause of better machine practice.

Canadian S K F Company, Limited
Montreal **Toronto**

SKF

502

Nine out of twenty-six shop operations are inspections



THAT'S why you can count on the performance of every S K F Ball Bearing. From the rigid examination of raw materials to the final inspection of the finished bearing—all through the making of S K F Ball Bearings there is a constant checking up and affirming.

From a manufacturing standpoint all this is necessary for economical production. Yet in a broader sense, it must mean longer and better service from every S K F bearing you use.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without re-sharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

Mr. Box Manufacturer,
Everywhere,
Canada.

November, 1920

Subject: Nailless Strapping

Dear Sir:—

To show how to get the business you would otherwise lose is the object of this **open letter.**

Shippers everywhere are seeking a satisfactory means of reducing the cost of their shipping containers. The meeting of this demand requires serious consideration and intelligent foresight on the part of box manufacturers.

The solution lies in advocating the use of lighter shooks in connection with nailless strapping, which scientific tests have shown results in a stronger, lighter and cheaper box and one that is sealed against pilferage.

Rather than have your prospective customers substitute some other type of container for wooden boxes, your good judgment will suggest that you test our claim that the Sig'node System is the answer to the problem. Elsewhere in this issue of The Canadian Woodworker interesting comparative tests are shown which bear out our contention.

Representatives at Toronto and Montreal will gladly demonstrate the method of operation of our system and advise as to size and cost of strapping best adapted for use on various boxes.

Strapping your shooks and veneers The Sig'node Way solves another shipping problem.

Get in touch with our Canadian representatives. It will pay you to do so.

Faithfully yours,

SIG'NODE SYSTEM, INC.,

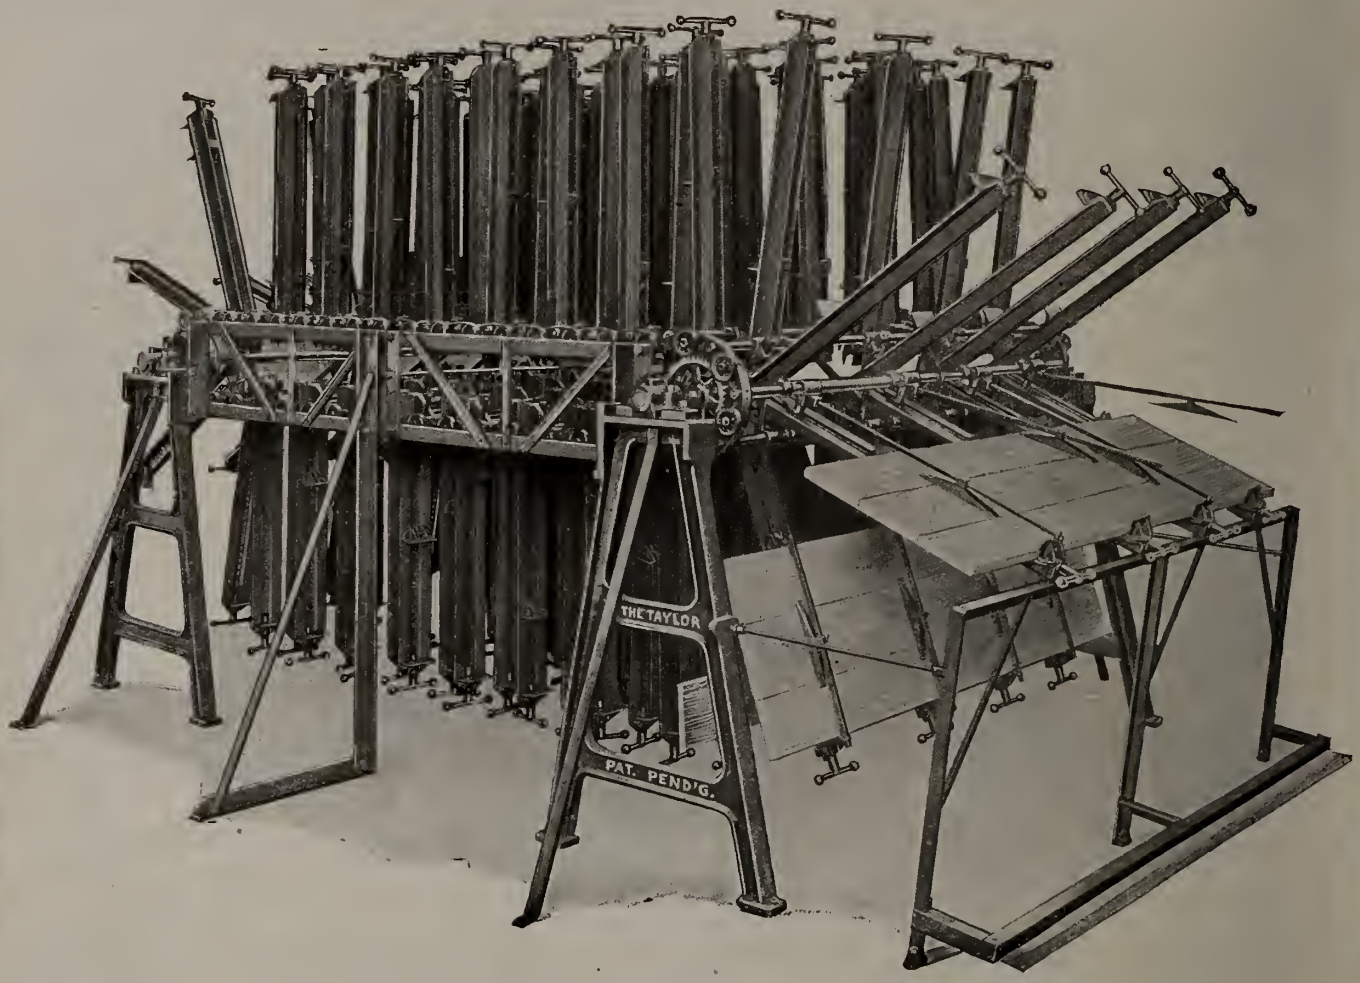
CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

DODD'S DOVETAILERS

The illustration on the right shows a front view of a 12 Spindle Dovetailing Machine, a compact machine that will be found exceedingly efficient and yet simple in operation. All machines are direct gear driven from countershaft, requiring no belts except the belt drive. Special gears on spindles, new style bed for straight or swell front and will work 1″ or ½″ centres, visible or blind dovetail. For furniture or box work. Made in five sizes: 10, 12, 15, 20 and 25 spindles. working 9″, 11″, 14″, 19″ and 24″ wide respectively.

The Assurance of a Perfect Finish

The ECLIPSE AIR BRUSH

For the application of Shellac, Stains, Fillers, Varnishes, Enamels, etc., as they should be applied by proper air brush work the "Eclipse" will be sure to meet with your approval. Here are the reasons: First, the material is not chilled in the application; second, the ease with which it is kept clean and operating; third, the thinner or solvent is not volatized or evaporated at high pressure; fourth, fumes are reduced to a minimum; fifth, it does not waste material.

The ECLIPSE AIR BRUSHES are being adopted by many of Canada's most progressive furniture manufacturers. Write us today for prices, etc.

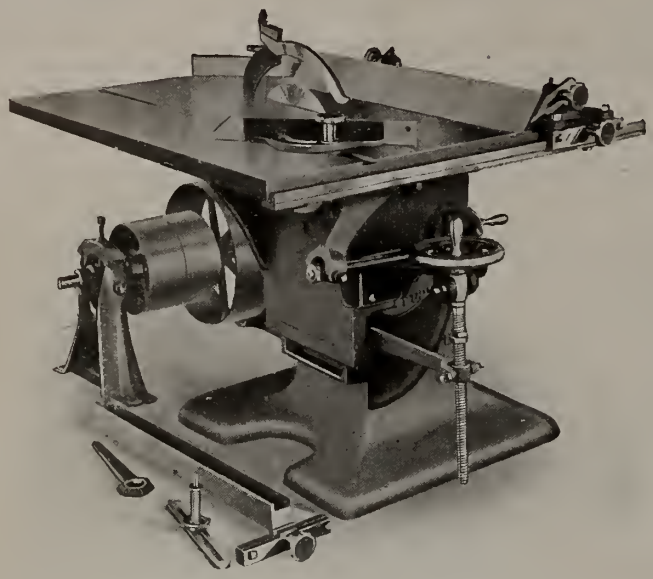
DODDS' Tilting Saw Tables

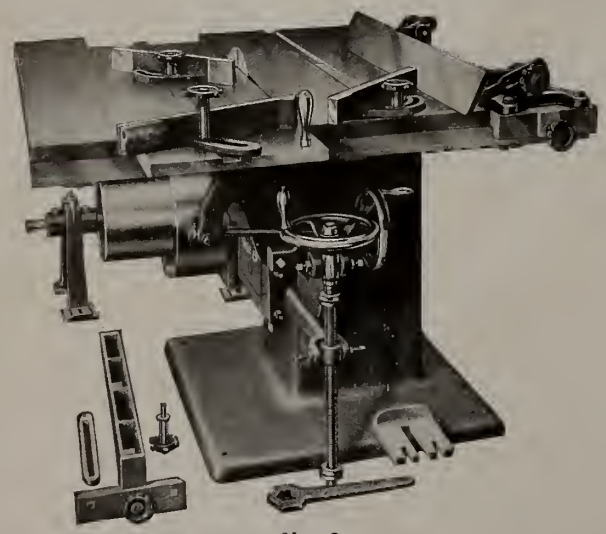


No. 4

The No. 4 machine is belt driven. Size of top, 36 in. by 43 in. Furnished complete with one saw, 12 in. or 14 in., tilting rip gauge, solid or two-sided rip gauge to be used on either side of the saw, two cross cut mitre gauges. Saw guard and spreader which does not have to be removed when tilting the table. Self-centering saw collar that will take any size hole in saw from 1 in. to 1¼ in. Removable iron throat to permit the use of dado heads. Table is raised and lowered with screw on lever and pitman, easily operated. Table is tilted by handwheel and screw and has micrometer index to indicate any desired bevel without the use of a square. Saw Arbor is in a yoke on top of the base and may be adjusted so as to keep the saw in line with the grooves in the table at all times. Countershaft has 10 x 4 tight and loose pulleys, driving pulley is 16 x 5, countershaft should run 700 r.p.m. Machine furnished with boring attachment if so desired. This makes a very complete outfit.

If interested write for prices and further details. We have a complete line of saw tables, stationary or tilting tops.

Improved Types Especially Adapted for Furniture Factories



No. 8

The table of the No. 8 machine is 40 x 44. The base is similar to what we have been using on our No. 4 Saw Table, only we have made it larger on the floor. The raising and lowering device is the same as on the No. 4 machine, with steel lever and pitman.

The Arbor is made of 3½-inch steel, running in long ring oiling boxes. We furnish a self centering saw collar which takes any size hole in saw from 1-inch to 1¼-inch, also one 14-inch saw on each machine. It will carry a 16-inch saw if desired.

Table is made with a center slide 12 inches wide with a movement of 24 inches. Has locking device and detachable mitre gauge. Can cross-cut with table extended to 24 inches, also rip up to 24 inches wide. Table has a removable throat that can be taken out when using dado. It also has two mitre gauges for regular work and a two-sided rip gauge that can be used on either side of the saw: also a tilting rip gauge to be used to cut bevel work when you do not wish to tilt the table.

Countershaft has T. and L. pulleys 10 x 4 inches, and the drive pulley is 16 x 5 inches. Countershaft should run 700.

All Dodds Saw Tables can be very conveniently arranged for direct motor drive.

When you decide you get more

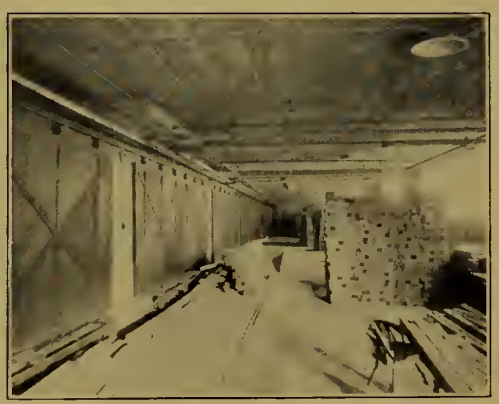
The Service that goes with every National Dry Kiln assures you of the good results our users always get.

This service starts with the rigid investigation by our dry kiln engineers of the special drying problem which the nature of your product requires and carefully supervises every stage of construction until the dry kiln is in actual operation. It goes further, in fact this service is continual—the results which you obtain are essential to our future business, and our experts are always at your command to see that you get satisfactory performance at all times and under constantly varying conditions.

The establishment of our resident dry kiln expert in Toronto has been especially undertaken to give our Canadian users quick and efficient service. If you are thinking of installing new kilns or are having trouble with your present equipment, get in touch with him.

C. A. FIELDS,
P. O. BOX 55
Toronto, Ont.

He will give you personal service at our expense. "Efficiency" is our watch-word—Best Results our aim. Wherever National Equipment is installed satisfactory performance is guaranteed.



Ten National Compartment kilns Prudden Wheel Co., Lansing, Mich.

Six National Compartment kilns, Brunswick Balke Collender Co., Dubuque, Iowa.

The National

1117 E. Maryland Street

on a "National" than a Dry Kiln

Our Engineers will help you decide on which type you need:

National Compartment Kilns
National Progressive Kilns
National Box Kilns

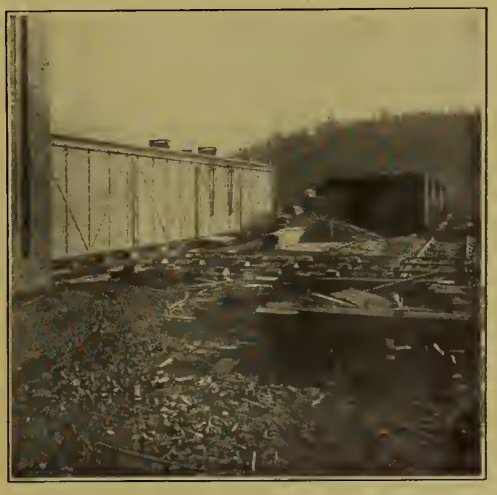
After it has been carefully and properly determined which type is most suitable to your particular requirements, a first-class set of plans is then drawn up by our specialists.. Certain standard plans and specifications for construction are used which enable our engineers to give you the most practical equipment at the most economical cost.

A force of expert erectors is at your service, and because of their experience and familiarity with the work always prove their value by a large margin of saving in erection costs. During construction a careful check is kept on the progress of the work—if you are in a hurry the value of this system will be readily appreciated.

Every part is manufactured in our own plant under our rigid inspection system. We know these parts are all in perfect working order before they are shipped to you. We also carry a complete stock of dry kiln parts and equipment, which is one of the reasons that manufacturers ordering a NATIONAL Dry Kiln are assured of having it within record time.

We can tell you many interesting facts about the success of National Dry Kilns where they are in constant use by America's largest manufacturers. It will be no obligation on your part to purchase if we send you this data. Would you like to have it?

National Progressive kilns are used by many manufacturers.



Complete lumber storage systems designed and furnished.

Dry Kiln Co.

Indianapolis, Ind., U.S.A.

An important step in swing saw improvement

EAGLESFIELD "Beltless" Swing Saw

This new idea machine is designed with a special view to economy, reliability of operation and compactness. It is especially adaptable to close accurate work, and with it many operations can be completed which have heretofore required cutting stock oversize and then joining to the final close dimensions. The elimination of belting and the use of ball bearings, with the motor directly connected to the saw mandrel

Ensures increased production and safety to the operators

The Motor is mounted on the lower end of column and directly connected to saw mandrel by a steel bevel gear, the saw mandrel is 1⅛ inch and is mounted in S.K.F. Ball Bearings. The steel bevel gear and the ball bearings operate in oil. The column is of channel steel, suspended from a rigid cast iron hanger of unified construction to insure rigid support and eliminate vibration. Each side arm of hanger having a four-way adjustment, which makes for accurate alignment. The column is adjustable six inches in length to accommodate various sizes of saws.

A rocker coil spring is provided in place of the ordinary counter-balance weight to increase speed of operation is so designed, that as soon, as the saw starts through the work, the spring is inoperative and the operator has only the resistance of the cut and the weight of machine to pull. To prevent the saw swinging forward too far, an automatic stop is provided.

The saw guard is of cast iron, extending completely over the top half of the saw. The handle is extra long and is so designed, in connection with the guard, that danger to the operator's hand is eliminated.

The machine is equipped with a 4-H.P. motor, of any voltage, 2 or 3 phase, 600 cycle current and one 16-inch circular saw. The motor speed is 3600 R. P. M. with the saw mandrel geared down to operate at a speed of 2200 R. P. M. Weight, complete, 350 pounds.

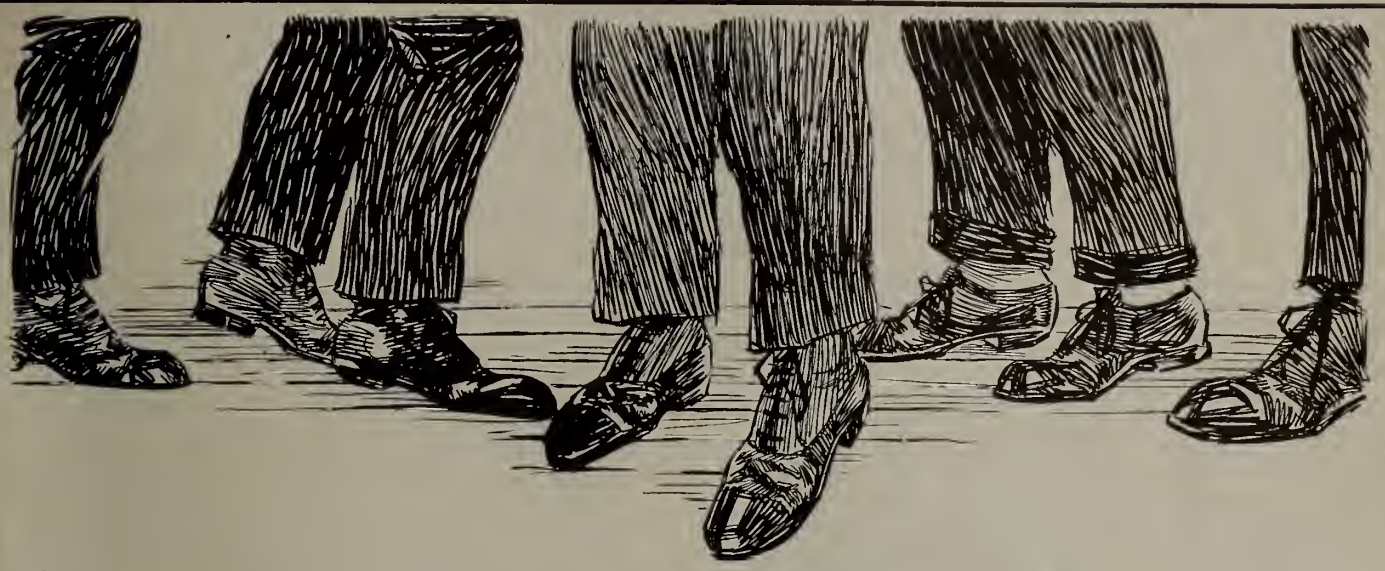
21st & Norwestern Ave.

INDIANAPOLIS - INDIANA



Tired Feet Reduce the Work You get *for* each Dollar *of* wages

Across the shop to the big jointer, back again to the bench; then to the big saw, then back again; still another trip to the jointer,—back and forth, all day long, year in and year out. How much is this wasted time costing you? How much is the consequently reduced energy costing you in man-power? Then figure in the time wasted in sawing and planing by hand,—slow tedious, inaccurate processes.

Is it any wonder that thousands of modern shops are being equipped with Wallace Bench machines?

ADOPT THE WALLACE IDEA

Make certain that your men remain at their benches, using their energy only in profitable work. By installing Wallace Bench machines throughout your shop, your men remain right where they belong, wasting no time on journeys between bench and tool. Wallace Bench machines are portable—they operate from any point on your electric light circuit as simply as an incandescent bulb.

One step and the workman is at his individual machine—a snap of the switch and his motor purs—a quick, true, sure operation and the work is done—accurately, economically and efficiently.

Now is the time when every second counts; every manufacturer knows that. Wallace Bench Machines will pay for themselves quickly and will bring you dollars for every penny of their cost. Any Wallace user will verify that fact without hesitation.

You owe it to yourself to get acquainted with the Wallace Idea —ask any first-class machinery dealer or inquire directly of us.

adopt the WALLACE IDEA at every bench

Ask Your Machinery Dealer

Practically all of the machinery dealers that know the needs of their customers and aim to advise their customers and supply that need, have Wallace Bench Machines in stock and will gladly demonstrate them to you. They are the class of man who would advise you to use these bench type machines on certain operations if advisable, regardless of their profits. They are good men to know and to consult, for the maintenance of this equipment. Being located in all principal cities, they are in a position to render our customers real service.

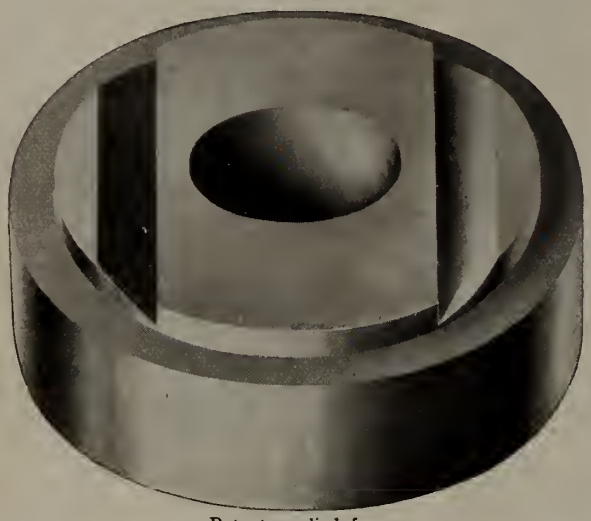
THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use



Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

A Hundred Table Tops Now— Seventy-five Before

THE operator here, is a good man—a steady, hustling, careful workman, but he says the best he was able to get out of a garnet belt was seventy-five table tops. It wasn't his fault. It was clearly up to the belt.

A Carborundum Brand Garnet Belt is on his machine now and he is turning out 100 tops to the belt.

Proving once again that

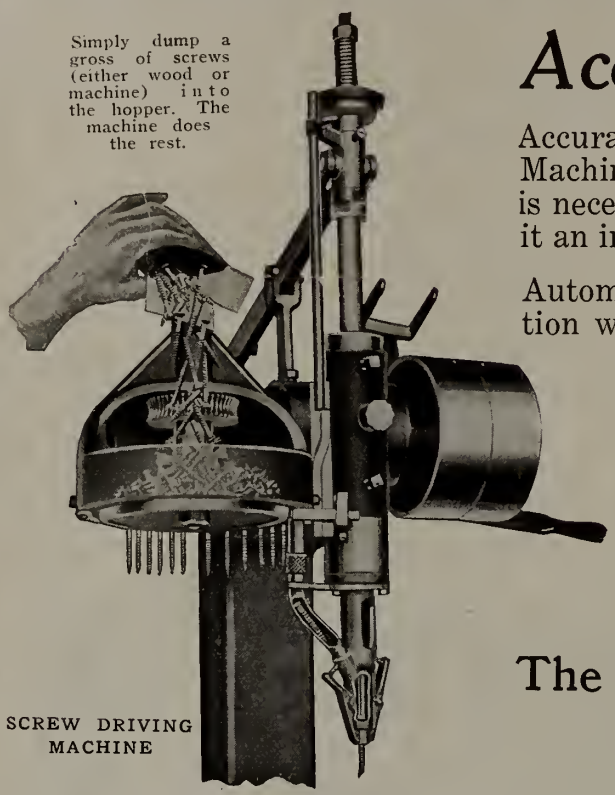
Simply dump a gross of screws (either wood or machine) into the hopper. The machine does the rest.



SCREW DRIVING MACHINE

Accuracy plus Speed

Accuracy in operation makes this Reynolds Machine an asset where quality production is necessary. Speedy manipulation makes it an important factor in economy.

Automatically perfect, its positive operation will enable you to drive 1000 to 2000 ordinary screws per hour without the services of a skilled mechanic. We can save you 85% in labour costs.

Write today, giving outside dimensions of your work and gauge and length of screws used and we will send you descriptive literature and list of users.

O.K'd by the Furniture Makers

The growing demand from furniture manufacturers for Nashua Veneer Tapes is conclusive proof of the popularity of this Canadian-Nashua product.

One of the most trying problems of the furniture maker is to get veneer tapes that stick fast when they are supposed to —and not until then!

Nashua Veneer Tapes

adhere quickly to the wood and make a good hinge to hold the two edges of veneer firmly. These tapes are wholly a Canadian product.

When you are in need of Kraft, Hollands or Coarse Cloth, send your order to Peterborough and we will fill it promptly.

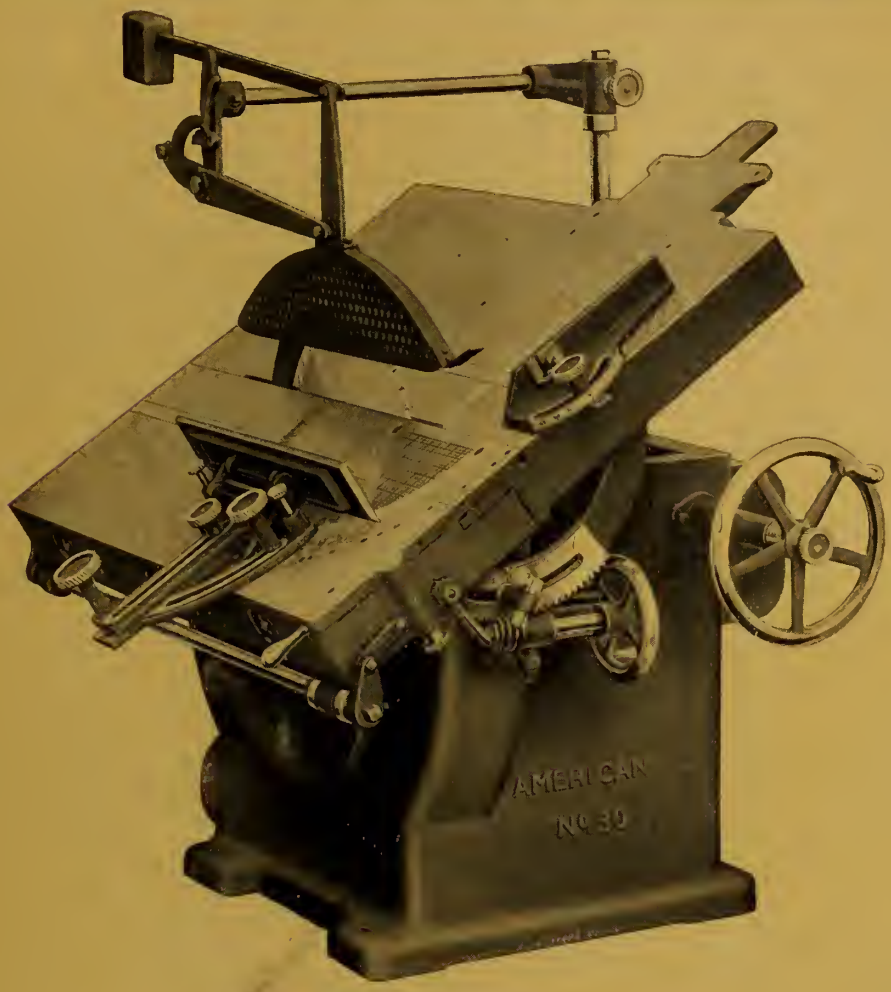
A Page from Our Catalog

AMERICAN WOOD WORKING MACHINERY COMPANY



Showing Table Tilted and Rip Gauge to Left of Saw.

American No. 30 Universal Saw Bench

OUR No. 30 Universal Saw Bench is a machine that will do ripping, cross-cutting and dadoing in an efficient and thorough manner. It will cut a perfect mitre; it will measure any angle instantly and accurately; it will cut off to length or rip to width —all without the operator having to do any previous calculating or even referring to a rule. It is built with extreme care, like an iron-working tool, to insure absolute accuracy of operation. "Built like an iron-working tool" is not merely a phrase with us—it is a fact characteristic of American wood-working machines. We know how, and do make iron-working tools of the highest order and these machines are of the same high class.

CAPACITY—Rips from 1-16 to 27½-in. and cuts off to 31-in. wide when saw is set for 2-in. thick. An 18-in. saw may project 5¾-in. above the table. The table tilts to 45 degrees for bevel sawing. Two 18-in. saws, 1⅛-in. hole, are furnished. If necessary one 20-in. saw (not adjustable) can be used. Dado heads 2½-in. wide can be used.

Write for large illustration and complete details.

HARDWOOD LUMBER

Thirteen Band Mills
Six Planing Mills
Eleven Flooring Units

Annual Capacity, 130,000,000 Feet

In a former issue we told of the hardwood stumpage which we have from which to produce lumber to supply our patrons; probably, however, those who purchase lumber would prefer some data as to our production of lumber rather than in regard to our ownership of trees.

We produced, during the first six months of 1920:

FOURTEEN MILLION feet of poplar lumber, including
- 1,000,000 feet of panel
- 2,472,999 feet of 1s and 2s
- 3,151,831 feet of Nos. 1 and 2 common.

TWENTY-SEVEN MILLION feet of oak lumber including
- 2,288,455 feet of quarter-sawn stock
- 4,916,456 feet of 1s and 2s
- 6,467,522 feet of Nos. 1 and 2 common

We produced also the other varieties of stock in poplar and oak which naturally would result, accompanying the manufacture of items above listed.

In addition to our production of poplar and oak, we manufactured millions of feet of basswood, ash, chestnut, hemlock and other varieties of such hardwoods as grow in the choicest sections of the Appalachian hardwood areas.

During these first six months of the year, we manufactured 11,567,253 feet of the choicest hardwood flooring, strip and parquetry, plain and quartered.

We produce standardized products.

We render a service possible only from Standardized Efficiency.

Yards: BUFFALO, N.Y. Mills: KNOXVILLE, TENN.; FONDE, KENTUCKY

The Best Teacher--

IS there to be a repetition of the high prices in the Spring of 1921 —as there was in the Spring of this year—or are you going to let experience be your best teacher and order now ?

Hardwoods

Present holdings of northern hardwood are about 40% below normal, and it is estimated that this year's cut is to be about 50% below normal. There is sure to be a general shortage, with consequent high prices.

Study your future requirements. Early purchasing and anticipation of future needs heads off a period of stampede buying with the consequent inflated prices.

DO IT NOW

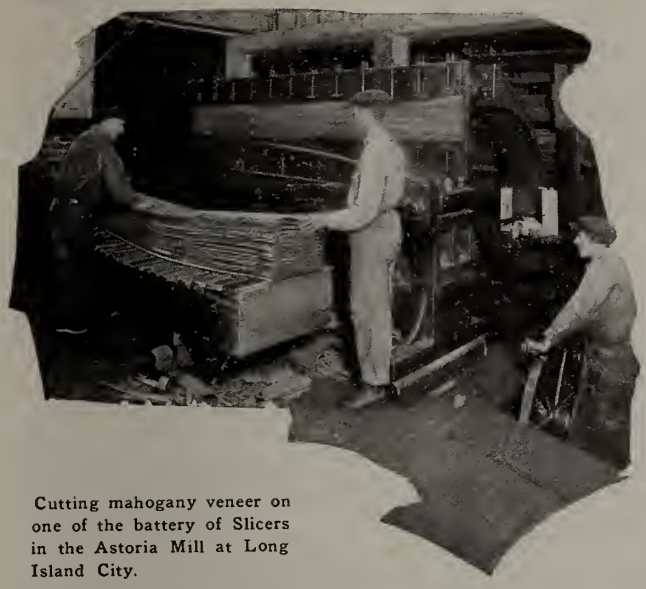
General Office: 1226 Conway Bldg., CHICAGO, ILL. **Band Mill: Clayton, La.**

ASTORIA MAHOGANY
LUMBER & VENEERS



Cutting mahogany veneer on one of the battery of Slicers in the Astoria Mill at Long Island City.

Slicing Twenty-eight to the Inch!

THE choice, figured mahogany logs, which our experts select for fine veneer making, are cut by huge diagonally operating knives or "slicing" machines. With these slicers a remarkable degree of uniformity in cut is obtained—an Astoria feature which has long been appreciated by manufacturers of high class furniture. This uniformity of cut is but another element in the service which over a quarter century has made us the largest complete mahogany lumber and veneer organization in the United States.

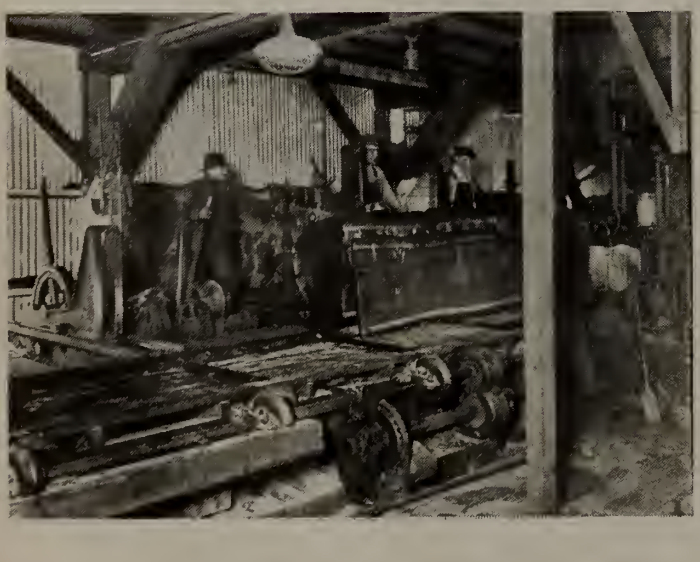
Quality Walnut

SECURED from all parts of the country an immense quantity of choice Walnut Logs, is delivered to our storage yard, which can accommodate two million feet.

The judgment of our buyers, backed by years of experience in the Walnut Industry, and the really unusual care devoted to manufacture, added to the splendid facilities afforded by our mill, enable us to assure our customers of the excellence of our lumber.

Our equipment is thoroughly modern and selected to permit the delivery to the trade of a superior product at a reasonable cost.



Frank Purcell

12th and

Kansas City

—Correctly Manufactured —Carefully Inspected——Promptly Shipped

WE have on sticks, at this time, over two million feet of Walnut Lumber, affording a wide range of selection to supply the demands of the trade.

If you have encountered any difficulty or delay, in the past, in securing your requirements at the time and in the manner you wish, favor us with your next inquiry and join the ranks of those to whom "Purcell Service" is now giving complete satisfaction.

American Black Walnut

Enjoys World Wide Appreciation

In spite of most unfavorable rates of exchange, excessive ocean freight tariffs, and limited financial resources Europe wants America Walnut and is now buying. Europeans know walnut is the finest cabinet wood grown, and rightly refuse to consider substitutes.

Virtues of Walnut should be fully recognized on this continent as every phase of the cabinet wood situation today points out the advantage of featuring American Walnut.

All American Walnut is good but Iowa really affords the best.

We are prepared to supply you with

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

Bureau Drawers That Slide

(and slide easily) after 200 years of service.

Try the drawers of an old piece of Walnut furniture—no matter how old, nor of what grade of workmanship. They slide easily—if they are Walnut. That is because Walnut doesn't shrink nor swell with the variations of temperature and humidity, and doesn't warp nor twist nor misbehave in any way—never a bit.

The supreme beauty of Walnut, in addition to the above qualities (and plus its "workability" and its "carvability"), accounts for the world-old supremacy of Walnut as a cabinet-wood—and its price permits its use in *every grade* of furniture that the careful buyer is likely to ever consider.

It will help you in your furniture buying to *know all about* American Walnut. (The furniture man will respect your discrimination, and you may be sure he will honestly give you what you want. He knows the facts—and is glad that you do.)

Don't fail to WRITE NOW for the WALNUT BOOK—edition de luxe—which will come by return mail with our compliments—and our confidence in your appreciation of it.

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION
Room 1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Vol. 20 **November, 1920** **No. 11**

Courage, Judgment and Aggressiveness

This special furniture number of the "Canadian Woodworker and Furniture Manufacturer" is a fitting momento for the most successful year ever experienced by the furniture industry in Canada. During the first months of 1920 the furniture factories were literally swamped with orders, and though operating to capacity were not able to cope with the volume of business offered. In the last few months the demand for many of the better lines has not been so strong, but should this quietness continue until the end of the year it is not likely to reduce the lead over other years secured in the earlier part of the season. Not all furniture factories have been affected by the lessened demand, as those making cheap and medium-priced lines and plants devoted to such specialties as desks and office furniture, church furniture and fitments, and store fixtures are working to capacity.

The furniture manufacturers are optimistic with regard to the future of their industry and have adopted an aggressive policy. True, conditions are quiet, and even uncertain, at the present moment, but there are many bright spots. One is that the retail trade is doing a fair volume of business but buying only sparingly. This is due to a certain extent to the fact that many retail dealers were well stocked, especially in certain lines, and that some of the larger stores have adopted a non-buying policy.

The national advertising campaign launched by the Furniture Manufacturers' Association a few weeks ago should be very beneficial to the furniture industry. The effects of publicity work of this kind are cumulative rather than immediate and by the spring of 1921 the furniture trade should be steadily gaining ground. Again, certain indications point to easier money. This should have a stimulating effect on building operations, which in turn will mean that more furniture will be required.

It is expected that when the different furniture manufacturers issue their new price list, toward the end of December, an attempt will be made to guarantee that the prices will not be changed for, say, a six-month period. This would be a very wise move, as not only would it stabilize the market but it should tend to reassure those dealers who have refrained from buying because they anticipated a drop in prices. The new lists will show reductions in many lines and increases in others, so that probably the present price level will be maintained. In the raw material market such items as lumber, glass and finishing materials have dropped in value, while other lines like furniture hardware, coverings and packing materials are stationary or slowly rising. As the price of furniture was never based on the peak of the raw material market, there has not yet been any change in manufacturing costs that would warrant or justify a material reduction in furniture prices.

The trying, uncertain period through which we are passing, though likely to be of short duration, is such as to test the fortitude of the strongest. Boundless courage is required so as not to be stampeded into hasty action—calm, business-like judgment to take full advantage of every turn of the market and earnest aggressiveness to seize and make the most of all opportunities. These qualities, together with faith in the future of Canada, can lead to but one result—Prosperity.

Art and Utility in an Appropriate Sphere

The Successful Co-ordination of Design and Craftsmanship Illustrated in Some Examples of Jacobean Furniture from the New Provincial Parliament Buildings at Winnipeg

"Every work of Art shows that it was made by a human being for a human being."
"Art is thoughtful workmanship." —*W. R. Lethaby*

IN a brief but noteworthy contribution to the Annual Furniture Number of The Canadian Woodworker last year*, the author advanced a special plea for the originators, designers, and craftsmen of the present day. The purport of his observations was that the achievements of the past should be only an incentive to greater effort in the present, and that the furniture designers and cabinet-makers of our own day and generation were required to execute work just as exacting, just as original, and just as beautiful as "the finest work done by famous men of their industry whose names are now household words."

In the following pages we reproduce further examples of furniture which bears the hallmark of individuality in special work. Once more, our selection is from some of the special orders carried out recently by The Bromsgrove Guild (Canada), Limited, of Montreal, whose Managing Director, Mr. E. L. Wren, A. R. I. B. A., has kindly co-operated in the reproduction of the accompanying illustrations. Those of our readers who may be in possession of our Annual Furniture Number of 1919 will be interested in comparing the illustrations reproduced on pages 75-77 of that issue with those shown herewith.

As examples of skilled workmanship in the application of sound principles of design, the furniture illustrated herewith is noteworthy. The illustrations are sufficient to show that the most exacting requirements of woodcraft and design can be fulfilled within our own borders, and that in the field of the woodworking industry, Canadian craftsmanship more than holds its own.

The Speaker's Chair, Provincial Parliament Buildings, Winnipeg.—A dignified and ornamental example of Canadian design and workmanship. Note the detail of the Manitoba coat-of-arms.
(This illustration is referred to as Fig. 8 in the accompanying article.)

The illustrations shown on the opposite page are all pieces selected from the carved oak suites installed in the Minister's private offices at the Provincial Parliament Building at Winnipeg. It may be mentioned in passing that this is one of the finest public biuldings erected in Canada during recent years. It was designed by the well-known English architect, Mr. Frank W. Simon, F.R.I.B.A.

In keeping with the requirements of a building of this character all the installations were required to measure up to a very high standard. Particularly was this so in the case of the woodwork and special furniture.

The excellent class of work installed in the Parliament buildings at the progressive Western metropolis is shown in the accompanying illustrations. The examples are of special interest to us in this Number, as they are carried out in the Jacobean style.

Possibly the outstanding point to note in the illustrations is that while the general principles of Jacobean design have been faithfully adhered to, no degree of utility whatever has been sacrificed to making a pedantic copy of the antique. The trend of opinion is increasingly in favor of impressing upon the modern designer that in originating new furniture in old styles, he should do so only so far as it is possible to make really useful furniture—furniture designed primarily to serve a useful purpose; and that the slavish imitation of old pieces, regardless of the uses to which the furniture is to be put, has resulted in productions unsuited to modern requirements, and can only be considered a setback in the furniture maker's art.

These observations will serve to introduce a brief description of the furniture illustrated on the opposite page.

In Fig. 1 we have a magazine table designed on correct and pleasing lines. This is a very practical piece of furniture and is quite true to style. The dimensions are 7 ft. by 2 ft. The fine carved pedestals are particularly worthy of note. The centre table shown in Fig. 2 is 4 ft. in diameter and is of similar design.

Distinguishing characteristics of correct design and finished workmanship are found in the Minister's

*Some Notes on Art in Relation to Furniture, By G. S. L.

Fig. 1.—A magazine table, designed on correct and pleasing lines.

Fig. 2.—Centre table, 4 ft. in diameter, of similar design.

Fig. 3.—Minister's desk, of Jacobean design—embodying all the adjustments of modern times.

Fig. 4.—Sofa, 7 ft. 6 in. long, with carved rail and feet to match. Covered in Canadian blue Spanish leather, Madrid finish.

Fig. 5.—Another pleasing example of the Jacobean style—a side-table.

Fig. 6.—Large bookcase—an effective expression of art, craft, and utility.

Fig. 7.—Desk comprising part of the Council Room furniture—built in sections of three.

Noteworthy Examples of Furniture in the New Provincial Parliament Buildings at Winnipeg

desk, shown in Fig. 3. While this desk retains the true character of the Jacobean, it embodies all the adjustments and accessories of modern times. While in all essentials it retains the character of the style chosen, it provides all the facilities required by the modern office specialist, even to the provision of a deep filing drawer for the care of the Ministerial correspondence. The carving is an attractive feature, as are also the panelling and brass drop-handles.

Fig. 9.—Council Room furniture—table for centre space, richly carved with lions' heads on trusses.

The inviting nature of the sofa shown in Fig. 4 will make this piece a favorite with the legislators of the Western Province. The length of this sofa is 7 ft. 6 ins. The carved rail, with feet to match, enhances its beauty, and effects the desired combination of art and utility. The sofa is covered in Canadian blue Spanish leather, in Madrid finish.

The two remaining examples call for little comment. They are finished examples of a special class of furniture. Both the side-table, shown in Fig. 5, and the large bookcase, shown in Fig. 6, follow the true Jacobean style. The carved details of both pieces are well interpreted. The lines are clean and simple, and the detail is attractive and interesting without being unduly ornate.

Passing from these examples, we come to the remaining illustrations, which are selected from the council room furniture at the Winnipeg Parliament buildings. These pieces are of walnut and are all hand-carved. They were designed by the architect of the building, Mr. Simon, and, as in the case of the other examples, they were made by The Bromsgrove Guild (Canada), Limited.

An outstanding example is the Speaker's chair—Fig. 8, reproduced on the first page. This chair is covered in blue leather and the carving is picked out in gold. The detail of the Manitoba coat-of-arms is a noteworthy feature.

The desks (Fig. 7) are built in sections of three or more, with a separate swivel chair for each member—numbering sixty in all.

The table for the centre space (Fig. 9), which is richly carved with lions' heads on trusses, is a particularly successful interpretation of its kind.

The Value and Application of Standards

Distribution of Information Through an Association—Lead to Greater Co-operation —Access to Same Set of Standards—Vast Benefit to Industrial World

By James J. Martindale*

(Last of series)

All lines of industry should be standardized and the standards kept in some central bureau for distribution as requested. Chair factories, furniture factories, phonograph cabinet factories, carriage factories, etc., should have made available for them the essential standards applying to their particular line of industry.

The war has eliminated a great deal of the old foolish jealousy between plant and plant in the same industry. The necessity to lick the Hun brought about a common use of plant experience, custom and methods never before experienced. Let us continue this good condition and in benefiting all industry benefit each member of that line of industry.

By further and more intelligent co-operation. Money has been saved by making deliveries from a number of distributing stores by means of one delivery system. Ford dealers in Detroit have a central purchase bureau where all accessories are purchased. They have saved money in having a unified and common purchase control.

It is to be expected, if practical methods are used, that the taking over of the Grand Trunk System in Canada will benefit the old Intercolonial and save money by lessening the administrative burden on the Intercolonial and obtaining better prices on purchases due to greater purchase volume. The merging of all army controls into that of Foch was one of the reasons for the decline of German power. Time, much effort and money was undoubtedly saved by the functioning of one head rather than the confused and unrelated action, as to time and purpose, of a number of army heads.

Why should a chair factory in Owen Sound, Ont., spend its money and time in setting up standards of accomplishment when last year a chair factory in Ottawa obtained standards on practically the same kind of output? A phonograph cabinet shop in Kitchener and a similar shop in St. Thomas, as well as other phonograph cabinet shops, should each have access to the same set of standards. This condition should be brought about by a central association spending the money furnished pro-rata by each contributing member of the association to obtain the essential standards of operation on the variety of work common to practically all plants.

These standards should be filed in the bureau's office—charted where possible, and ready at all times upon call, for distribution to members. Thus can industry be standardized and an association made to render a practical service perhaps never before achieved.

Today, shops in large cities render monthly reports as to their labor turnover to a central bureau. This bureau compiles all these various turnover figures and sends out a complete report to each contributing firm. These shops are of quite a dissimilar nature, yet the reports are most useful in the big problem of handling help.

To carry the idea still further—it would be an excellent plan to show up each month a statement of standard and actual hours for each plant in an industry. The good to the industry as a whole and each listed plant would be marked. Friendly rivalry would be developed. Old ways would be continuously bettered. New methods would be frequently introduced. All would benefit. The worker—the employer—the consumer.

*James E. Morrison Co., Industrial Engineers, Detroit.

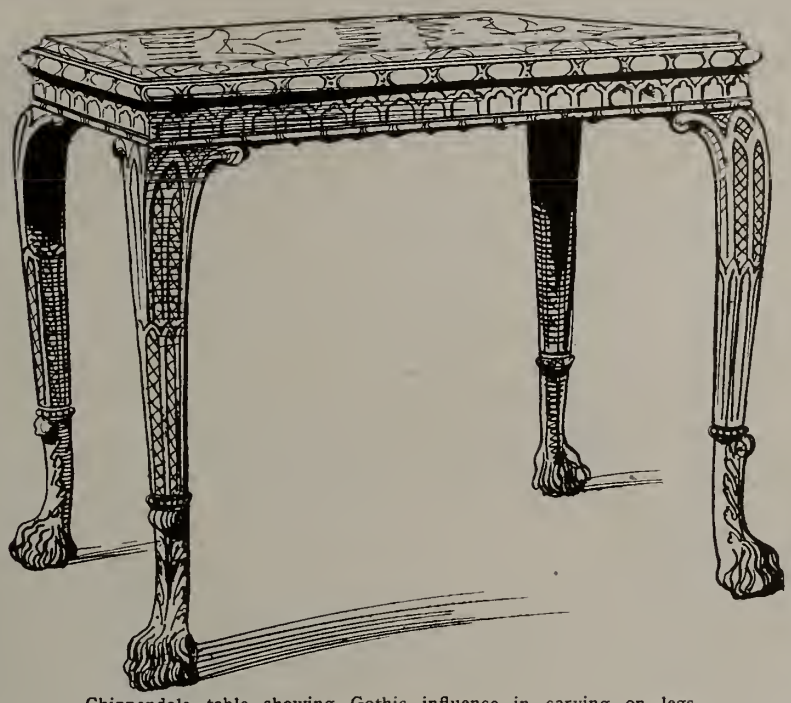
Thomas Chippendale, the Master Designer

Product of His Hands Almost Perfect in Symmetry and Proportion—Delicate Carvings Chief Form of Ornamentation—Noted Particularly for His Chairs— Some Fine Examples of Chippendale's Work

By H. C. Williams

With the dawn of the age of mahogany came Thomas Chippendale, a carver and master cabinetmaker, who has left a name which has become a trade term to mark a certain style in furniture.

His designs were especially adapted to the new wood, relying solely upon the delicate carving for ornament and rejecting all inlay. The material used by Chippendale and his school was the splendid mahogany from the great untouched forests of Spain, which were producing at that time, lumber, the like of which in dimension and quality is now unprocurable; and at that time many a fight ensued and many lives were lost in shipping the stolen mahogany to England to supply the demand for furniture.



Chippendale table showing Gothic influence in carving on legs.

Previously the greater styles of furniture which were left for the examination of posterity were made, mainly, for the use of the wealthier classes, although in Jacobean days, settles and chairs, especially the Yorkshire and Jacobean types were in more common use, and the homely pieces of Queen Anne suggest less luxurious surroundings.

Chairs Probably Best Examples

In 1754, Chippendale published the first edition of his book entitled "The Gentlemen's and Cabinetmakers' Director," and in it he says "My designs are calculated to improve and refine the present taste, and suited to the fancy and circumstances of persons in all degrees of life." His book of designs, as may naturally be supposed, was not greatly bought by working classes, but several copies were distributed in the north and other parts of England, so that local cabinetmakers began at once to fashion their furniture after his styles.

Chippendale based his designs on Chinese Gothic and Louis XIV. and XV. work. The "frets" and "traceries" found in his pediments, friezes, chair legs and backs, and his pagoda cabinets are the direct result of the Chinese influence. The Gothic was not successful and he did not follow it to any great extent, so that his style may be termed "Chinese French."

Of all his furniture, his chairs are the best known, the four noted examples being the "Lattice," "Ribbon," "Ladder" and "Wheatsheaf. The last named he evidently borrowed from the Queen Anne chair. Chippendale revolutionized the styles and for the first time in the history of the manufacture of furniture in England, all European makers turned their eyes to that country in admiration of the style in vogue there; and of course in search of new designs.

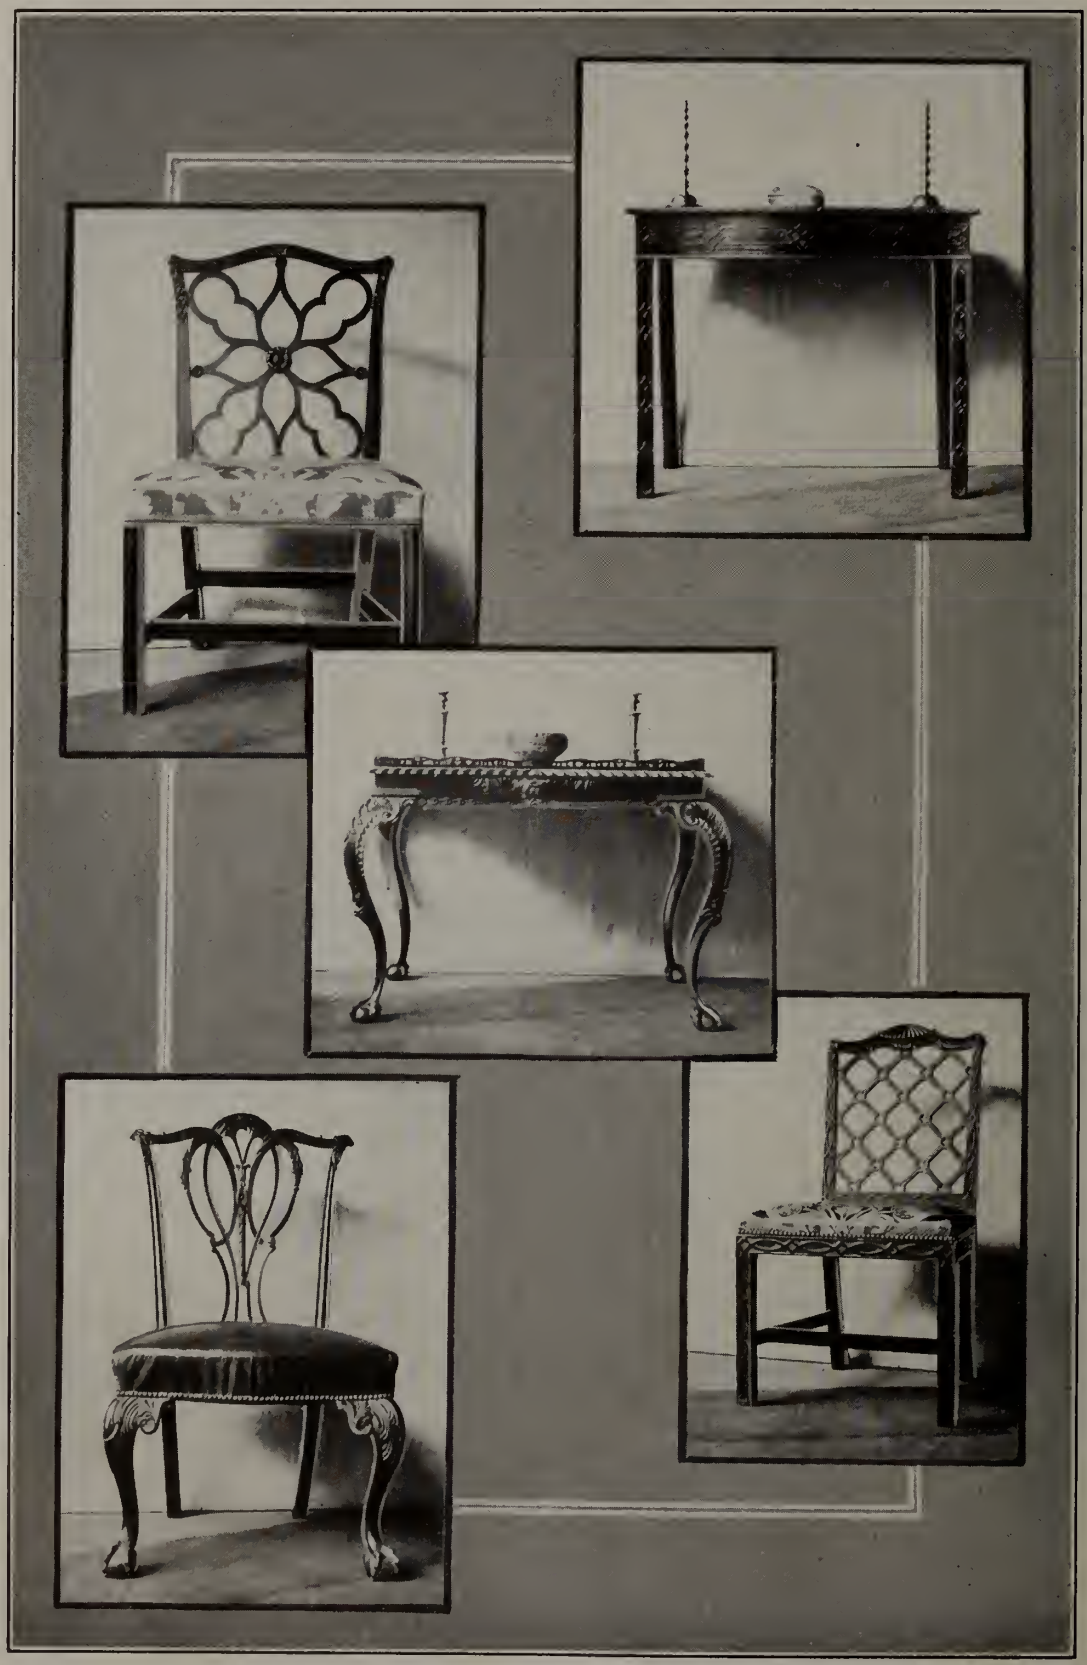
It is supposed that Sir William Chambers, the architect of Somerset House, whose fondness for Chinese ornaments produced quite a rage, and who built the pagoda in Kew Gardens, London, gave Chippendale another source of inspiration.

Hastily glancing at some of Chippendale's work, it might appear that originality was not his strong point. The claw and ball feet were not his own, he borrowed them, together with the wide seats from the Dutch or from earlier English furniture under Dutch influence. His style also shows the Louis XIV. French decoration, and in his ribbon back chairs he uses the Louis XVI. ornamentation. But Chippendale was the most perfect adapter England has ever produced; his adaptation became original under his hand. He was the Prince of chair makers; his chairs were never unsymmetrical; he knew the exact proportion of ornament that the structure would gracefully bear. The splats in chairs he made himself are of such accurate dimension in relation to the open spaces on each side that his touch alone betrays the hand of the master which was absent in the imitations of his followers.

Although his chairs were so greatly sought after on account of their great beauty of design, he made many other objects of furniture. The mirrors he designed are wonderful examples of fine wood carving. Bureau bookcases, card tables, settees, sideboards and ornamentals were made by him. These tend to show, by the diversity of technique, that there were several people at work carrying out his designs.

Shows Gothic Influence

A very beautiful Chippendale table, dating about 1750, is shown in the accompanying sketch. This has a drop-in marble top, which is an early feature of Chippendale's work. It is exceedingly effective, but unfortunate because of the great weight it gave to the table. Nothing could be finer than the skillful way the Gothic carving has been adapted to the shape of the cabriole leg. The pearl carved rings with



Beautiful examples of Chippendale's work, showing exquisite detail and proportions

the curled-over leaves below, finished on the lion's-paw feet, are quite an inspiration.

Ladder-backed chairs was another Chippendale line which appeared to have been unusually attractive. Two types are shown herewith, one in which the cross-rails are pierced and interlaced, and the other shows a plainer design of cross-rail. This latter armchair is a particularly good example of Chippendale's work. The edges of the legs, arms, back and top-rail are ornamented with a small, prettily-carved rope pattern. The set which this chair represents is a rare and noteworthy one.

A beautifully carved Chippendale chair and table

The chair with the elaborately-carved ribbon back is in walnut. This suggests a craftsman other than Chippendale, but, however, is a good copy of Chippendale's first ribbon-backed chairs. These created great satisfaction and were much sought after when first designed. The photo of the beautiful chair shown in the lower left hand corner of the large illustration is one of a pair of genuine Chippendale chairs. It has the wheatsheaf-design back, is covered with pig-skin and has hand-carved cabriole legs, with claw and ball feet. These chairs, together with the heavily-carved table, in centre, were bought from a collection in Bath, England, by the Thornton-Smith Co. of Toronto. This carved table is a splendid example of Chippendale's work, showing strongly the French influence. The Gothic fretwork, which surrounds the top, is also typical of his work.

A type of lattice-backed chair is shown with fretwork carving on legs and sides. This fretwork design is very characteristic of a large part of Chippendale's work. He also employs the lattice back in many different forms. The other chair, with rosette in centre of back, shows a strong Gothic influence in the shape of the pierced frets. This chair has a very pretty rope pattern running along the outside edge of the back. The small side table shown was another of Chippendale's favorites. It has the serpentine front. The nulling on the edge and the fretwork design on the legs, sides and front, are of great decorative value.

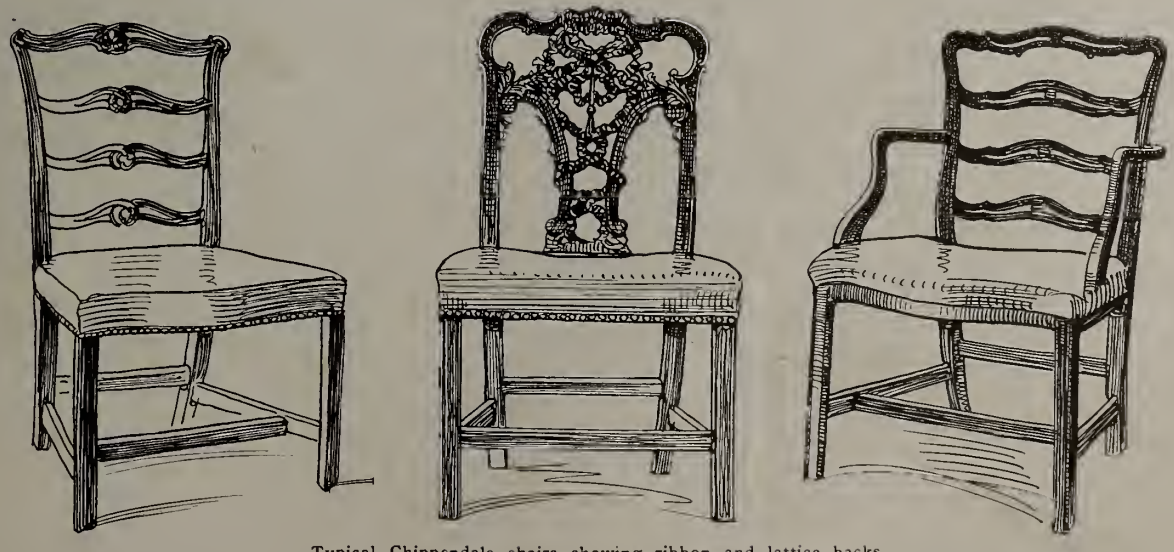
Another attractive chair and table is illustrated. The chair is one of a set of twelve which, with the table, formed part of the contents of an old English residence. The chairs are in mahogany, with claw and ball feet and are upholstered in green leather. The table is also in mahogany, with cabriole legs and claw feet. Both are tastefully ornamented with well executed and appropriately designed carving. The table top consists of two slabs of marble, one on top of the other. As intimated previously marble tops are found on many of Chippendale's tables.

Chippendale is credited, by many, with being the greatest of all the old designers. His influence is plainly seen in several of the succeeding periods.

Furniture Manufacturers to Meet

A sectional meeting of the Furniture Manufacturers' Association was held in Toronto, Nov. 2nd and 3rd. Detailed cost figures, dealing with the different grades of furniture, were presented by the cost accounting department. Present costs do not warrant any marked reductions in furniture values. It is expected that many of the manufacturers will issue new price lists the latter part of December. These will probably show slight reductions on certain items, while on other lines, in all probability, higher prices will prevail.

It was decided to hold a general meeting some time during the latter part of November, the date not having been set definitely.



Typical Chippendale chairs showing ribbon and lattice backs.

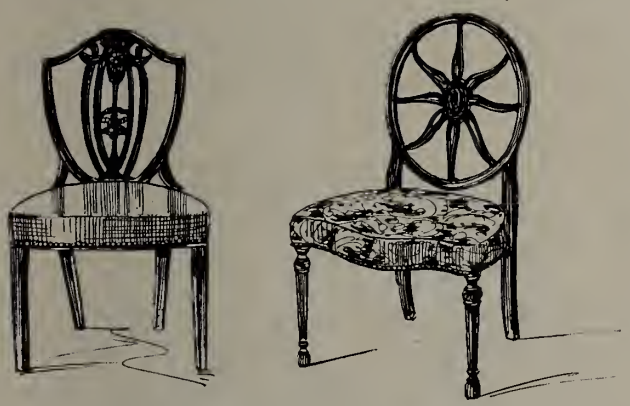
Simplicity as Expressed in Furniture

Lightness and Daintiness Characterize Productions of Hepplewhite—His Chairs Particularly Noteworthy—Features and Details of This Style of Furniture

By M. N. Wright

A style of furniture very popular at the present time is that fashioned after the designs introduced by George Hepplewhite in the latter part of the Eighteenth Century. Some of these were published in book form in 1790 by A. Hepplewhite & Co. (The "A" standing for "Alice," wife of George Hepplewhite, who died about 1786.) The Hepplewhites did not claim that their designs were original, for in the preface to their book they say, "Our judgment was called forth in selecting such patterns as were most likely to be in general use



Hepplewhite chairs in ribbons and wheel or oval backs

and in exhibiting such patterns as were necessary to answer the end proposed and convey a just idea of English taste in furniture for the home."

In these designs, which include chairs with pierced backs, bookcases, sideboards and bureaus, the influence of Chippendale and certain Dutch craftsmen is very evident. The individuality of Hepplewhite's style is of a lighter and more elegant fashion to which French finesse and Adam spirit contributed their influence. His might well be termed "a school of elegance and utility." Extreme lightness characterizes the most of his work, in fact he often sacrificed strength to lightness, and were it not for the fact that his furniture was built of Spanish mahogany, a very close-grained tough wood, it could not have stood up under ordinary usage. The results achieved in this paring away were extremely attractive.

Partial to Inlays and Carvings

The firm of Hepplewhite & Co. were among the first to introduce painted or japanned furniture (a process different from the lacquer or Vernis Martin) into England. Under Sheraton this painted furniture developed into an emulation of the fine work of Watteau, Greuze and others.

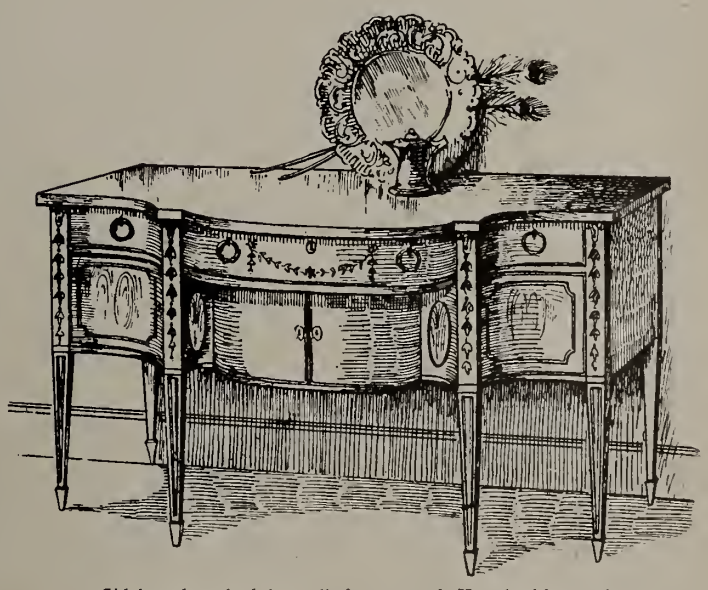
Hepplewhite was fond of inlays and carvings. His furniture is largely inlaid, with panels in the most beautiful wood and the edges usually banded. There is an absence of mouldings on the fronts of doors, drawers and similar places. A certain proportion of his product was partly painted and partly inlaid and the Prince of Wales' feathers are often found carved on the centre of the chair backs or japanned upon the splats. This japanning was a kind of painting peculiar to the East, but was not lasting in its effect.

His chairs are particularly noteworthy and are, perhaps, the most famous of all his furniture. They are usually distinguished by their oval and shield-shaped backs, but the wheel-shape, heart-shape and straight-back were also used by him. Carved lotus and bell flowers often appeared on the backs of these chairs. The sketches included show a number of typical Hepplewhite backs, including heart shape, Prince of Wales' feathers, shield-back and wheel or oval back. The Hepplewhite chair arm, including the support, is always curvilinear, being very similar to the forms appearing in Louis XV furniture, but much more slender and graceful.

Proportion and Simplicity

Some of the characteristics of Hepplewhite's style are the straight leg with spade foot, bell flowers in swags or rows, the shell, the draped urn, the lotus and the Prince of Wales' feathers. He was given to festoons and tassels in his draped work and the stripe was his favorite seat cover. This latter feature indicates that he kept abreast of the French fads and fancies. It might be well to state here that Hepplewhite seldom upholstered the backs or arms of his chairs. Sometimes he attached small pads to the arms. These were so small as to be almost ridiculous, resembling closely small pincushions.

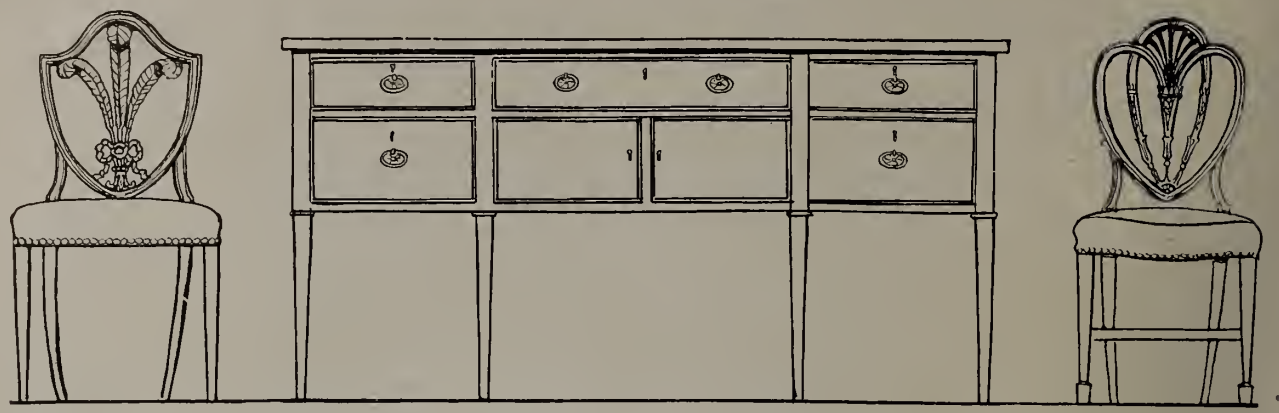
The sideboard illustrated has a perfectly straight front and is without inlay of any kind. A simple cock beading runs around the drawers and doors. The legs



Sideboard embodying all features of Hepplewhite style

are tapering but without the spade foot so common to Hepplewhite's work. The handles shown are typical of those used by the designer himself. The beauty of this piece lies in its proportions, simplicity of detail and the elegance of its lines. Proportion is rather an indefinable quality, but is that which gives the subtle charm to many of these old pieces. This sketch is the exact replica of an old model and has been reproduced by the Thornton-Smith Co. of Toronto.

The smaller sideboard shown embodies many of the typical Hepplewhite features, such as the slender tap-



Prince of Wales' feathers — An excellent design in Hepplewhite sideboard — Shield back chair

ering leg terminating in the spade foot, the festoons and swags of bell flowers and the general air of lightness he gave to all his pieces. The concave ends, as embodied in this piece, are typical of this designer. This is in contra-distinction to Sheraton, who usually made the end section of his sideboards convexed.

Hepplewhite's sideboards generally contained one long centre drawer and a shorter drawer at each end. Beneath these were usually deeper drawers or cupboards. However, Hepplewhite himself made many pieces which did not conform to this rule. The legs of these sideboards were sometimes plain and then again were ornamented with a fall of bell flowers in satin-wood and terminating in the spade foot.

The name of Hepplewhite is included by many with those of Chippendale and Sheraton as being among the foremost interpreters of the spirit of the late Eighteenth Century.

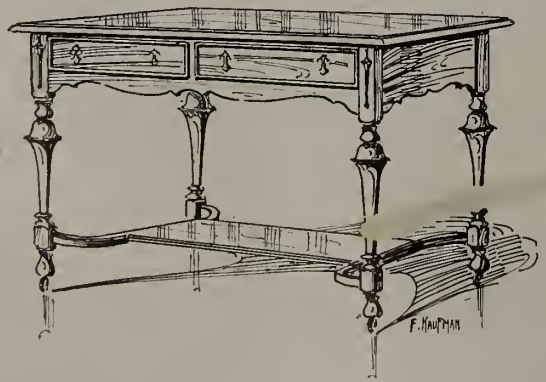
The Style Known as William and Mary

Might be Termed Transitional Peeiod—Development of Furniture in Solid Walnut —Influenced by Jacobean and Dutch Style—Turnings Used to Good Effect

By J. F. Clarke

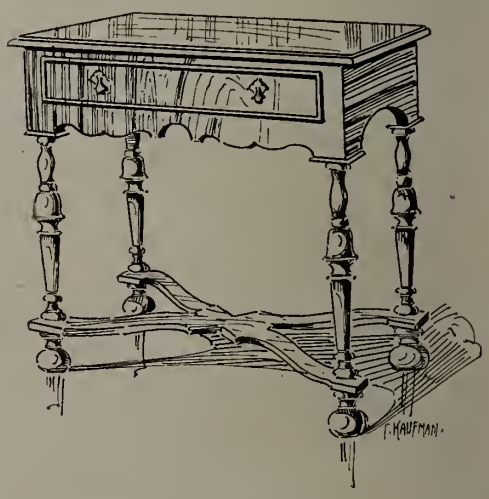
THE reign of William and Mary, 1689-1702, was notable for the great change made in the design, material and construction of furniture, owing largely to the introduction of foreign ideas by the Dutch craftsmen who were brought over by the King and his followers. This movement in art and design, English craftsmen were compelled to follow and in a manner it prepared the way for the more homely style of Queen Anne.

The beautiful English Renaissance created by Sir Christopher Wren, under the patronage of the King and Queen of the time, became the essentially English style of interior decoration associated with that period.



Modern Adaption of William and Mary

The walls of the rooms were laid off into dado and filling and then subdivided into large panels with bevels, sometimes very elaborately carved. Architraves, cornice mouldings and freizes were all executed in oak and beautifully carved. Doorways and over-mantels seemed to have received special care. In the best examples of the former, richly-carved architraves and pediments, supported by elaborate trusses, were used. High



Early English table in William and Mary style

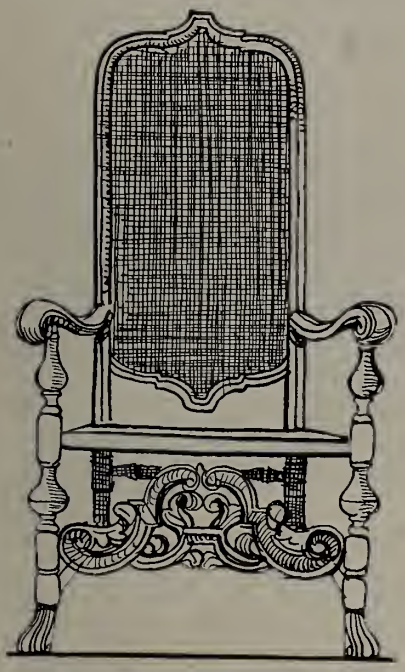
relief festoons of flowers and fruit exquisitely carved with limewood by the famous Grinling Gibbons, used as frames to pictures, mirrors or panels, comprised most of the over-mantels.

Marquetry as Means of Decoration.

In the early part of William and Mary's reign furniture was made of oak veneered with Italian walnut, banded with other woods and decorated with burl and

marquetry in naturalistic patterns or birds and flowers —the tulip being extensively used.

The use of marquetry was becoming more general. This commenced with the decoration of small objects such as clocks and similar articles. It differed from earlier marquetry in construction, which consisted of cutting spaces and fitting in pieces of different woods



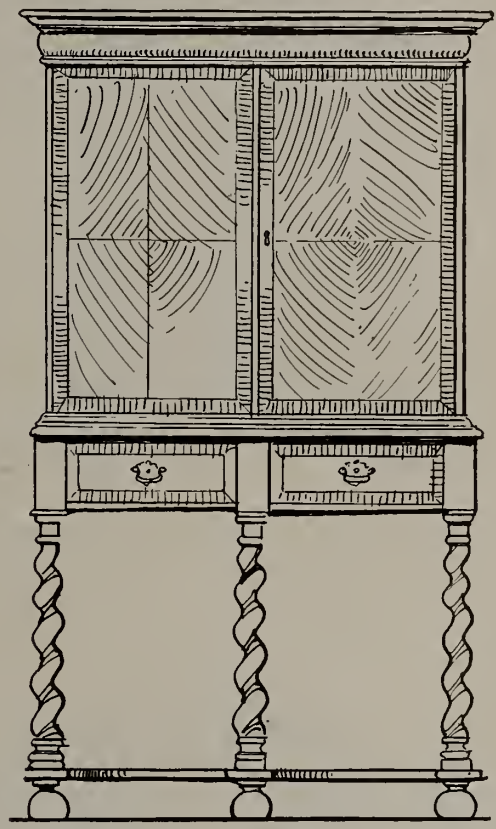
Typical chair of William and Mary period

or materials, whereas the newer method was to lay down pattern and background together as a veneer. This, of course, necessitated large flat surfaces in the furniture to be decorated.

At first the marquetry was confined to Italian arabesque and birds, somewhat later developing into the bold, Dutch style, as mentioned above. These two styles amalgamated later in the reign of William and Mary and developed finally into a series of fine acanthus scrolls and geometrical patterns of lines and burls. The presence of jessamine in the marquetry either in ivory, bone or hollywood indicates that the piece belongs to the William and Mary period.

This period might well be called a transitional period as it serves to link the Jacobean with the Queen Anne. The influence of the earlier English style and of the imported Dutch workmen is clearly seen. The Flemish chair, with cane seat and back, which was a feature of the late Jacobean furniture, was further developed. Another Dutch innovation, which was beginning to make itself felt about this time, was the cabriole leg. To a certain extent this revolutionized the design of the chair, table and chest of drawers.

The furniture of this period developed into the glorious creations of the age of solid walnut. At the time it became very fashionable to collect china, consequently furniture had to be adapted to accommodate



Cupboard in William and Mary with tapered twist turnings

the new class of ornament. Cabinets were made to take vases, beakers and blue bowls in their shelves. The plain walnut card-table and the beautiful Dutch grandfather clock were also introduced in William and Mary's time. Lacquered furniture was another importation of William's from Holland, many eastern

Some Notes from a Designer's Sketch Book

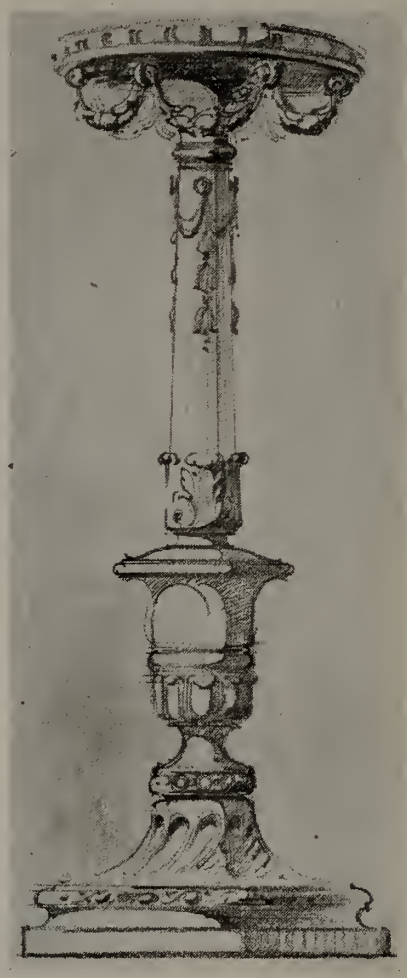
Together with a Reference to Spanish Renaissance

By G. S. L.

[The majority of our readers will recall with pleasure the article entitled "Some Notes on Art in Relation to Furniture" by G. S. L., which appeared in the Annual Furniture Number of the Canadian Woodworker and Furniture Manufacturer, last November. We are glad to be able to include in this year's special issue another article from the same gifted pen. The author, whose modestly forbids his name being used, is a well known designer of the creative order—one who has designed the furniture and interiors of many of our most noted structures. Recent commissions executed by him include the special woodwork and furniture for the Parliament Buildings at Ottawa and Winnipeg.—The Editor.]

Apart from consecutive and sustained studies and independent of the well-known styles and periods, one is constantly running across curious and unusual examples of designs, and the following types culled from notes made many years ago, may be of interest. It must be understood that these sketches are not to scale and that only the form and character of the examples have been considered.

A simple but rare type of Egyptian chair—from British Museum—is indicated in Figure 1, an interesting feature being the upholstery on seat and back. The flat painted decoration would be picked out in very definite blues, reds, yellows, etc. The general characteristics show a prototype of the Greek, the Pompeian and the Empire periods.



The equivalent of our modern lamp stand. Fig. 13.

A sketch of a very old Runic chair, from a model in the South Kensington Museum (date unknown), is illustrated in Figure 2. The main purpose of a chair is here well understood and the construction is sound and honest. The Celtic type of interlacing enrichment as against the plainness of the structure shows a proper sense of proportion and restraint—altogether a beautiful design. It could be well adapted to modern requirements—for hall or country-house furniture, say, with a little touch of gold and color to give it interest. It is a pity that these Runic and Celtic types and forms of carving and decoration are not more fully understood and developed. The flat interlacing strap-work would lend itself to an immense variety of treatments, and for carved work would not incur any wastage of material.

An Italian walnut chair, illustration 3, dating about the 17th century, from the South Kensington Museum, in which there is a sweetness of proportion and honesty of design. How few designers would have been content to leave the lower portion of the straight, back legs untouched, and note how the plain wooden seat and open space enhances the richness of the upper part of the back. Although these chairs are usually in walnut, I have seen them executed in oak, fumed and waxed only, with great success. A pancake cushion of leather is an improvement for comfort, but the wood seat has more character.

Our next illustration, Figure 4, is a Flemish chair in walnut, 1660, from the South Kensington Museum, and is a fine example of a folding chair, sturdy, but not coarse. The plain cowhide seat offsets the rich arcading and turned work on the back, and both seem properly balanced by the simple yet effective treatment of the legs.

A fine old example of the English Settle, first half of the 17th Century, is shown in figure 5. It is of oak with elm panels. The manner by which the somewhat top-heavy back is balanced by the massive legs is very clever. If the back is reduced in height or the legs made thinner, it will at once be seen how well thought out is this simple problem in balance. Doubtless the back was made high for some definite purpose, and if not the great Francis Bacon shall defend it, for he says: "There is no excellent beauty, that hath not some strangeness in the proportion." Perhaps his Lordship himself sat on this very seat. It has something of his character.

An illustration of a type of chair that used to be common in the north and midlands of England, especially in Yorkshire and Derbyshire, is found in sketch No. 6. Most examples are more ornate than the one here shown, which is sometimes called a "Cromwellian" chair. Nothing could be simpler and its austerity and efficiency would surely have satisfied the great Protector.

It may seem something of a shock to jump from Cromwell to Louis XIV., and one hardly expects to find the severity and simplicity indicated by the sketch (Fig. 7). This example is from the Musee des Arts Decoratifs, Paris. The arms are supported by turned members, but the lower parts of the legs are very cleverly changed into octagonal forms. Possibly the upper part of the back is somewhat out of harmony, yet experience shows that it is risky to take from or add to these old models. They always have the knack of seeming just right. Types very similar to this are to be found in the English, Italian and later French Renaissance.

In figure 8, we have a prototype of our modern lamp stand. It is also of Louis XIV. origin, in walnut, richly carved and guilded, very ornate and advanced in character as compared to the Louis XIV. chair, but it is dignified and well proportioned and stands with a sense of security, which cannot be said of all lamp stands. The remaining sketches are of

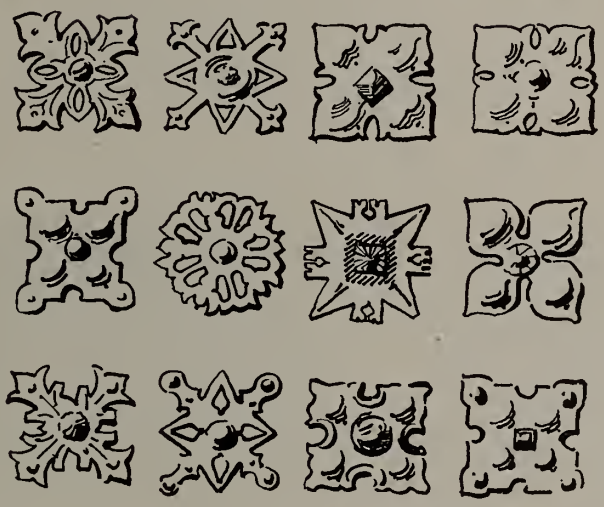

Fig. 15—Examples of nail-heads used by old Spanish craftsmen.

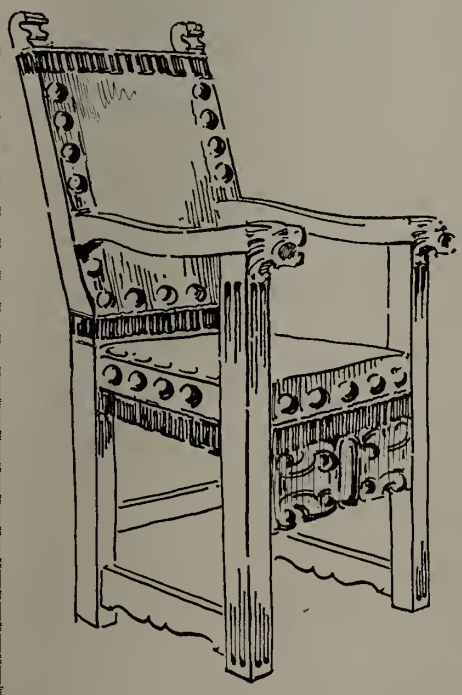

Fig. 9—Spanish Renaissance chair embodying simplicity and sturdiness.

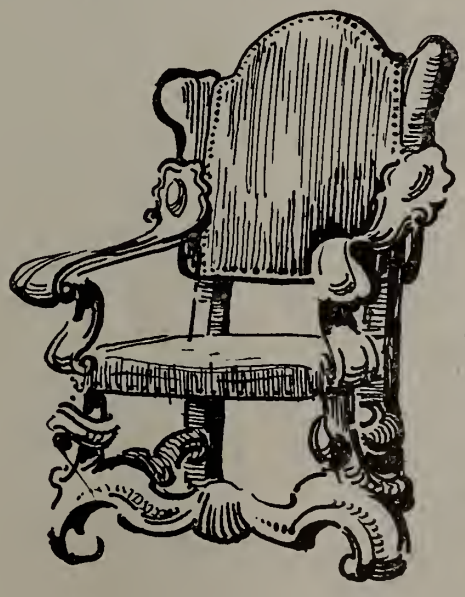

Fig. 11—Quaint old 17th Century chair from Salamanca.

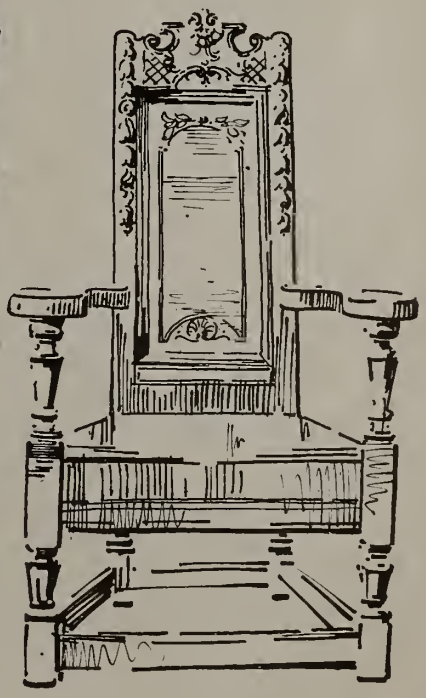

Fig. 7—Louis XIV. chair. Note how legs are changed to octagonal form.

Spanish Renaissance furniture, of which not a great deal is known. Indeed until the last 20 years little was known of Spanish Renaissance architecture. Andrew H. Prentice, the English architect, made a tour through Spain and is responsible for a splendidly-illustrated book of measured drawings dealing with the architecture and ornament of early Spanish Renaissance, and this work must be consulted by any designer at all interested in the subject. Indeed it is absolutely essential that a designer should have a thorough knowledge of the architecture and interior decoration of a style or period before he can attempt a proper understanding of the furniture or equipment of that style.

Simplicity and sturdiness is embodied in the type of Spanish Renaissance chair shown in figure 9. Seat and back is in leather, with the very large nails common to this period and heavy fringe trimmings. It is taken from South Kensington Museum.

The tenth illustration shows us a superior and beautiful Spanish chair from the South Kensington Museum, in carved chestnut, seat and back of embossed and incised leather, "Cordova Leather," and again the large Spanish nail-heads giving a very rich and grandiose effect. Spain was famous for its decorated leather and the best work came from Cordova. Cordova leathers became known the world over in those days. The early leather workers would imitate brocades upon their leather, using beaten silver and all the brilliant colors applied in oils or tempera. Beaten gold was used later.

Salamanca was the place of origin of the curious old 17th Century chair found in the eleventh sketch, and while the lines are hardly sound in principle, yet there is a quaintness and character to the piece that arrests attention.

The true Spanish Renaissance style lends itself particularly well to cabinets, calling for rich and massive treatment, and figure 12 is an example of a book-case cabinet in this style. The enrichment and grandeur of these pieces do indeed recall the glories of old Spain, and furniture of this magnificence demands a proper setting.

The equivalent of our lamp stand is shown in figure 13. Its richness of detail and grace, with stability, speak for themselves.

Another example of the Spanish Renaissance cabinet is found in sketch 14, the doors of which show a very interesting and characteristic treatment by the use of ornamental nail-heads.

There are endless and beautiful specimens of these nail-heads, a few of which are shown in figure 15. The old Spanish craftsman excelled in all forms of metal work, as in fact they showed mastery in all arts and crafts, and a study of any of the work of ancient Spain will enrich the mind of a serious student.

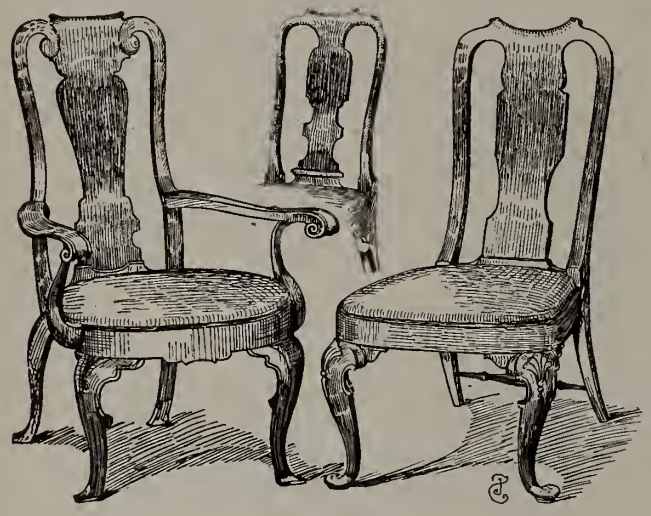
Features Embodied in "Queen Anne" Style

Influenced Largely by Dutch Design—Development of Cabriole Leg—Adapted to Many Kinds of Furniture—In Strong Present Day Demand

By C. Theodore Eichelsdoerfer*

THE style termed "Queen Anne," starting in the reign of William and Mary, and, outliving the sovereign whose name it perpetuates, was still popular throughout the reign of George I and practically the whole of that of George II.

The Dutch influence with which "Queen Anne" types are pervaded entirely revolutionized the furniture styles of the early and late Stuart times. Chairs in "Queen Anne" styles began to be shaped in accordance with the anatomy of the human frame and



Queen Anne chairs with typical backs and legs.

became not only more graceful, but infinitely more comfortable.

Cabriole Legs Become Popular

The chair first claims attention and, as the leg was the feature that underwent the greatest change, it may be mentioned here that the "cabriole" leg, which was imported from Holland, had been originally copied by the Dutch from French examples. This leg was adapted to the various positions it had to occupy, and was not only used for chairs, but for sofas, low seats and was also introduced into cabinet work, where the carcase part is raised from the ground. Here the whole leg becomes heavier in appearance than when used in chairs. Then again, when used as a table leg it was elongated, but still retained the "cabriole" form.

In "Queen Anne" furniture of the less expensive variety the "cabriole" leg was not enriched in any way, but, relied for its effect on the outline alone. The carver soon found in it a feature on which his work might be fittingly employed and we first saw the curve at the top of the leg terminating in a simple scroll. The toe, also, now began in a crude way to resemble the paw of an animal.

Carving Employed to Advantage.

On what is termed the knee or upper curve part of the leg a "shell" was sometimes carved, and, later, further elaborations followed till the knees became very ornate, and the claws, instead of merely resting on the floor, were made to grip a ball of wood. Sometimes the toe took the form of a "hoof" and occasionally the animal's paw was omitted altogether, the leg terminating at the toe in a "spoon-shape" or an enriched scroll resting on a small cushion or block of wood. Later, "Chippendale" took the "Queen Anne" forms and elaborated them considerably till the whole leg was covered with attracting enrichment.

The seats of chairs of this period are seldom, if ever, retangular, but are narrower at the back than the front; very frequently, too, the plan of the seat is curvilinear.

The easy chair came into vogue at this period and much more attention was paid to the support of the head and shoulders of the occupant. The well-known Windsor chair put in a first appearance and so eminently comfortable was it found, that it has remained popular down to the present day.

In "Queen Anne" chairs too, the work of the upholsterer was requisitioned. Until this time loose cushions had been employed on the hard seats. The fully upholstered or "stuffed over" grandfather chair, now made its appearance. The arms of such chairs are in many cases set back from the front of the seat to allow for the ample folds of the early Georgian Dresses.

"Queen Anne" and Georgian are more or less synonymous terms, the fact being, that with the advent of William Mary the Dutch forms were introduced, and so strong was their influence that the style was continued well into the time of the Georges, and Chippendale's early work was to a certain extent a highly ornamented "Queen Anne" type.

The "Queen Anne" tall-boy like the rest of the

A very attractive Queen Anne desk

furniture of the period is fitted with the "cabriole" leg.

Drop handles were largely in use. These are exceedingly comfortable to the user, besides possessing considerable artistic merit.

The woods employed in the manufacture of the earlier types of "Queen Anne" furniture in England, were chiefly oak, walnut, beech, and chestnut, but on the introduction of mahogany in 1742, it was, as soon as its merits were once appreciated, very largely used. Satinwood inlay too is occasionally found. For the present day demand of "Queen Anne" style furniture, mahogany and walnut are used almost exclusively.

Architectural Design Adapted to Furniture

Adam Bros. were Architects Rather than Cabinet Makers—Furniture Designed to Suit their Interiors—Inspiration Drawn from Classic Arts—Their Work Marks Transition Period in Furniture Styles

By Walter Wrench, Montreal, P. Q.

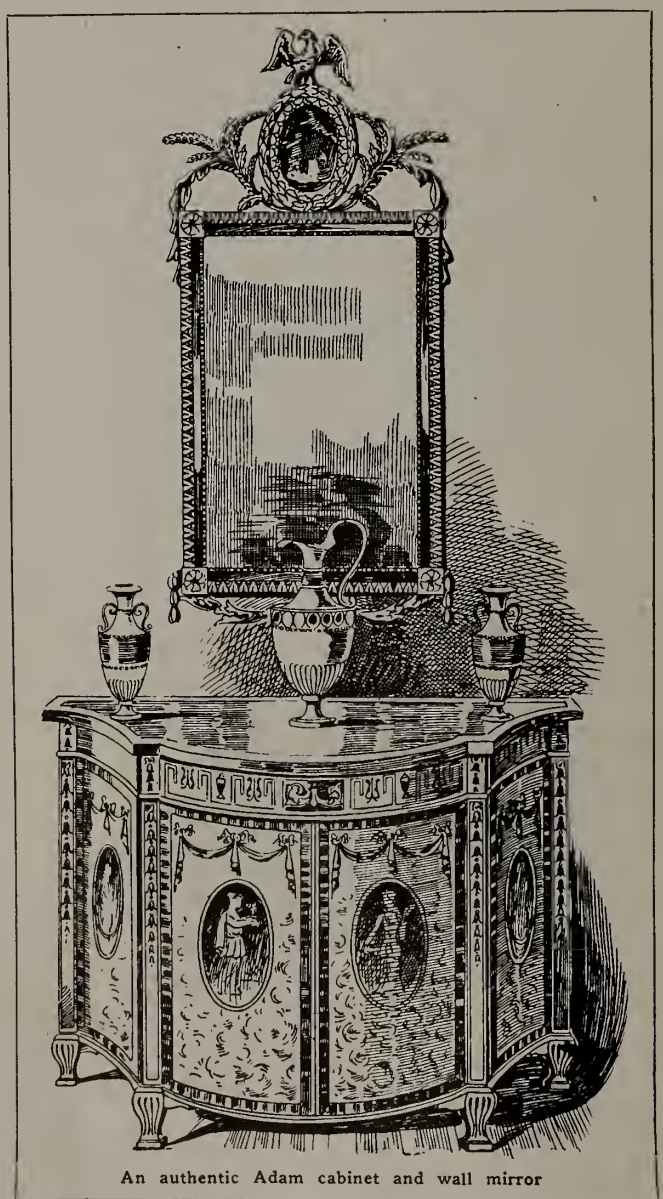
TO Robert and James Adam, sons of a Scottish architect, and lovers of beautiful furniture, we owe the style designated by their name; a style which has stood the test of time, and has today a large measure of popularity, a popularity which shows no indication of abatement. Robert was undoubtedly the master mind of the partnership, his brother, the business man of the two, while an artist of merit, had not the genius which characterized the younger man.

In order to appreciate the influences which served to mould the Adam ideals of decoration, a brief resume of the education and studies of Robert must be undertaken. He was educated in the University of Edinburgh, where he obtained the rudiments of the profession of architecture, later proceeding to Italy, he became a pupil of a French architect of note. In due course he obtained the degrees of F.R.S. and F.S.A. Whilst in Italy he paid particular attention to the classic forms of architecture and decoration, as handed down in the old, original examples, always with the purpose of mastering the pure motifs which underlie the classic Roman and Grecian styles. The rediscovery of the Neopolitan citys of Pompeii and Herculaneum had centered the attention of the civilized world upon ancient architecture and there can be no doubt that Robert, realizing this, determined to turn the trend of fashion to account.

French Influence Felt

That he was influenced to a great extent by French artists is certain, since he numbered one of them as an instructor and many as his friends. As his style is contemperaneous with that of Louis XVI. it is but natural that we find many specimens of his which directly reflect the best forms of design then being popularized in France. He published his first volume on Italian art in 1764, following this work nine years later with the second, devoted almost wholly to Pompeiian forms and decorative motifs.

First and foremost, the Adam brothers were architects, (Robert Adam was appointed architect to George III), and secondly decorators and designers. Their architectural triumphs are many, among the most famous being the Adelphi, Sir Watkin Wynn's house and Harewood House. The designing of furniture came to them as a natural sequence, a desire to fabricate furniture strictly in keeping with the classic architectural style they had adopted. It is imperative then for the modern designer to realize the fundamental principles which underlie their furniture designs, — that is that they are the expression of classic proportions and motifs applied to furniture.

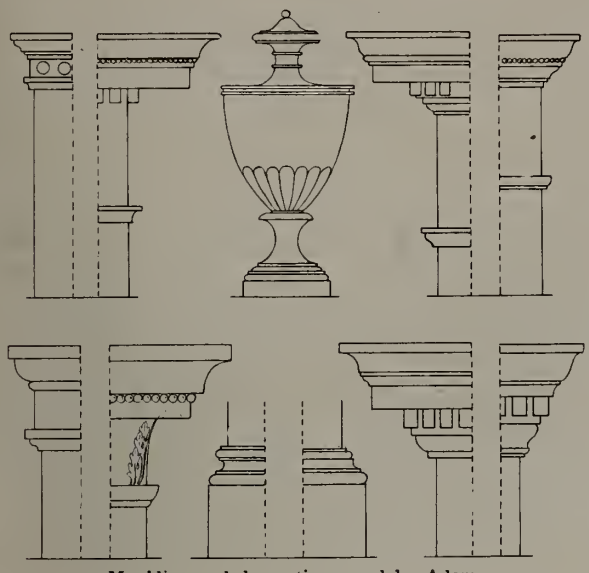


An authentic Adam cabinet and wall mirror

The Adams were architects and decorators who had turned to furniture designing in order to carry out the spirit of their inspiration in the furnishings which were to be used for the embellishment of interiors of their creation. They were not furniture makers, as were Chippendale and Sheraton, since they did not themselves manufacture furniture—it was made for them by the leading cabinet makers of the time, in London and elsewhere.

High Prices Paid

As illustrating the lengths to which the Adam brothers went to ensure perfect harmony in the interiors they carried out, let it be mentioned that it was their common practice to design, not only the furniture, but also the rugs, tablecloths and silverware to be used in the ensemble. The smallest detail was not overlooked to obtain a complete and harmonious whole, even the fabrics used for the purpose of upholstering being designed in their studio. To follow out a scheme to such detail naturally required much money, and it is certainly true that prices paid for furniture and decora-



Moulding and decorations used by Adam

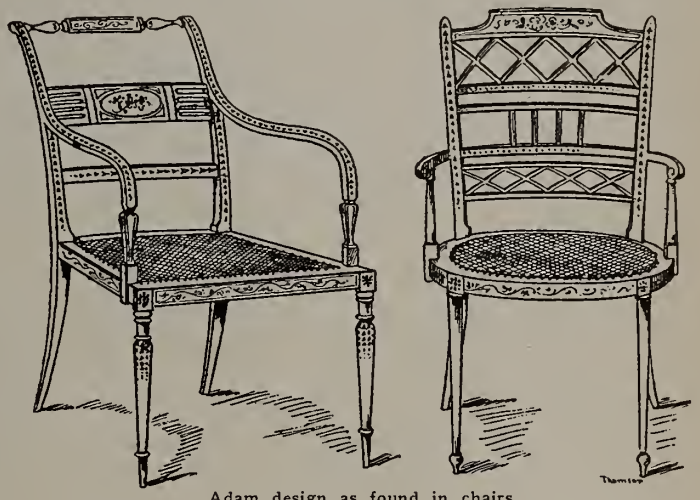
tive accessories in this era were such as are rarely paid to-day.

Lightness and Spirit of Refinement

A spirit of refinement characterizes all their work, a spirit of grandeur and dignity. The mouldings they developed were light, the members small and skillfully placed to show to best advantage under whatever lighting conditions confronted them. They made use of many of the geometric forms used in the classic styles, such as octagons, hexagons, ovals, circles and lozenge shapes. Greek and Roman vases and urns were often utilized, as also were grotesque figures and rams heads cleverly adapted in their designs, with very graceful effect. Painted panels, oval, circular and lozenge shape by Angelica Kaufman, Antonio Zucchi and Pergolesi, are to be found on many speciments of Adam furniture and in examples of a somewhat later date, Wedgewood plaques and friezes inset. Wedgewood was quick to see the possibilities of the style of the Adam brothers, as applied to pottery, and his creations, so popular to-day, followed as a result.

Carving was used as the principle form of decoration, with composition ornament as a substitute, where much repetition of the same motif occurred, as in embellished mouldings. Inlay was resorted to sparingly as a form of enrichment as Robert Adam seems rather to have preferred to simulate inlay with painted forms, obtaining at the same time thereby the same effect and a greater latitude in design.

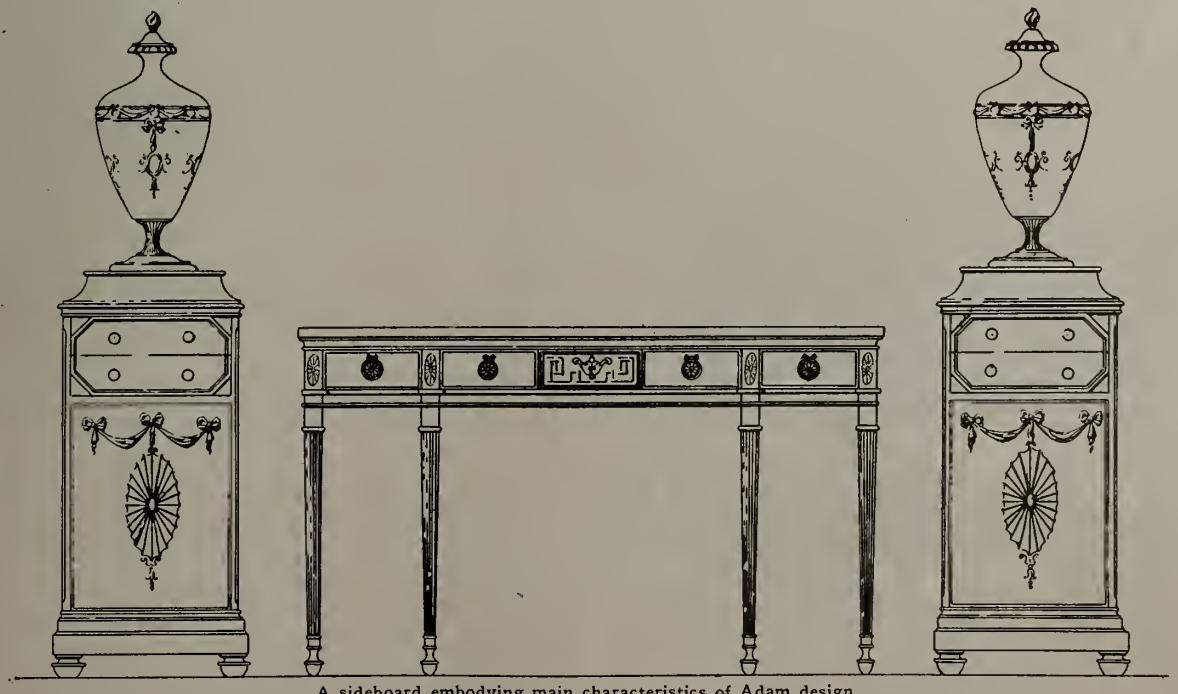
The application of veneer was skillfully planned to obtain the best results from the natural beauty of the



Adam design as found in chairs

woods used and these were the days when finely-figured woods were more common than in our own day. Mahogany was the lumber in which the finest speciments of the Adam style were made. Satinwood and Harewood also served in some cases, but for the most part only in the lighter forms of furniture, such as used in the drawing room.

The real artist in Robert Adam is evidenced in the



A sideboard embodying main characteristics of Adam design

magnificent effects obtained by him in painted furniture. By this is meant, not that furniture of his which was decorated with painted motifs, but that which was painted over its entire surface. This he frequently resorted to, to produce harmonious interiors, carrying out his wall tints in slightly deeper shades in the furniture. The carvings of such pieces were blended in with color, not necessarily of the same tone as the surface tint, but in perfect color accord with it. Mouldings, flutings and beadings were also blended in this way with very delicate and pleasing results.

The Adam brothers produced every variety of furniture. Their sideboards have a particularly stately and dignified appearance and it is this characteristic that I have endeavored to impart to the interpretation of this style illustrated herewith. The pedestal ends and knife box urns are a feature inseparable from their types. The legs of the table itself are intended to be turned and beaded, although these could be square tapered with a moulded foot, and still be quite appropriate.

Chairs as designed by Robert Adam were of many types, mainly of the rail back variety, although samples are found in which a cane panel forms the back, in such cases the seats also being caned. Usually, however, Adam seems to have preferred upholstered seats, covered with appropriate fabrics, for these types far outnumber all others, both as shown in his original designs and in authentic specimens preserved to-day. Legs of furniture in this style were either square moulded or turned, the turned legs showing great care in proportion and the spacing of members for the best effects. Fluting or beading served to enrich these members except where left plain to be decorated with painted motifs.

Since candles were the sole means of illumination in this era Adam gave much thought to the means of disposing them to the best and most artistic advantage, which he did by means of candleabra, girandoles, and brackets of beautiul conception. The explanation of the enormous framed mirrors used in conjunction with console tables by Adam, is found in the application of his principles of lighting,—it being intended to intensify light by reflection.

A Skillful But Little Known Designer

Designs of Hepplewhite and Sheraton Influenced by This Craftsman—Made Furniture for Every-day People—Plain in Ornament and Given to Curved Lines

By H. H. Rolphe.

A contemporary of Sheraton and Hepplewhite, though not so well known a cabinet maker and designer, Thomas Shearer by name, produced a line of furniture bearing the stamp of his individuality and genius. While the name of Shearer may not be so well known, it is claimed by some that the furniture of both Hepplewhite and Sheraton show the effect of Shearer's style. As one writer puts it, "whether Shearer influenced Hepplewhite or Hepplewhite Shearer is a question for which we are not likely to find a definite answer, yet a considerable portion of the Sheraton style was founded on Shearer lines. The presumption is that if a man of such decided personality as Sheraton was affected by Shearer, Hepplewhite was no less indebted to this great but forgotten designer."

An attractive tea wagon by the F. E. Coombe Furniture Co.

Shearer, however, had his limitations and they are strongly marked. No contemporary designer, not even Sheraton at his best, can be held to have surpassed him in the combination of daintiness and simplicity, but he was far behind both Sheraton and Hepplewhite in the application of the more florid form of ornament. What he may have considered his masterpiece is a sideboard, the first of its kind, so far as dated sideboards go, to be really a sideboard and not a sideboard table with drawers introduced. It may or may not have been the first attempt to combine a sideboard table and the pedestals and vases which went with it into one article, but it certainly is first as regards date of publication. Its interest is, however, more historical than artistic. It effectually disposes of the idea that we are indebted for the sideboard proper to Sheraton.

Characteristics of His Style.

Shearer's furniture is thought by many to be inclined to be solid and heavy. The ornamentation is usually simple and easily carried out. A characteristic of many of his pieces is the serpentine front; in fact he tried to introduce the "ogee" or reverse curved line wherever possible. Thus some of his pieces contained very few straight lines. One would probably be correct in saying that he aimed to produce good substantial furniture for every-day use and for every-day people.

The accompanying illustration shows a reproduction of a Shearer sideboard by R. W. Folkes of Toronto. Mr. Folkes is a lover of that which is beautiful in the work of the old furniture designers and takes great delight in strictly following them both in design and construction. It will be noticed that while the proportions and general effect is pleasing, curved lines predominate in this sideboard.

In producing this piece Mr. Folkes followed the methods and construction of the old-time cabinet

A fine example of a Shearer sideboard

maker. It is what might be termed a true reproduction. The work is all done by hand, the joints are either dovetailed or mortised and tenoned; in fact, there are not any nails used in its construction. The doors and ends of the pedestals are curved or hollowed and in construction are crossbanded with crotch veneer on solid mahogany. The top, back and other heavy pieces are all made from solid wood. The curves are secured by making parallel grooves in the mahogany core and inserting small wedges. The dimensions of the sideboard are 7 feet 4 inches long, 25 inches wide and 30 inches high.

The doors are centre hung on special swivel hinges. Owing to the curve in the ends of the pedestals and the shape of the doors themselves, this is practically the only way they would swing.

Beautiful Veneer Used.

The ornamentation is very simple, consisting of small wheel scroll carvings, raised reeds and cockle-shell, together with carved lions' feet and simple carvings at the top of the pilasters. The beautiful crotch veneer in the panels and the crossbands on the rails and stiles, together with a crossband border on the top, all add to the attractiveness of the piece.

Shearer was also noted for his tables. His style generally speaking, resembles that of Hepplewhite. Sheraton admired him so profoundly that much of his style is founded on, or influenced by, this little known designer.

No Snbstitute for Hickory or Ash

No substitute has been found for the high-grade hickory and ash required by handle makers and the vehicle and agricultural implement industries. The supplies came principally from the South where the most accessible supplies have already been cut. So scarce has the supply become that large firms are literally combing the territory to secure material. It is said that five years more will see the end of the supply of the northern upland ash, which is preferred to the swamp-grown variety of the lower Mississippi Valley.

The Stvle Known as William and Mary

(Continued from page 113)

craftsmen having been brought to that country to teach their art. The claw and ball foot was also introduced from China. This was taken from the old Chinese symbol of the dragon's foot holding a pearl, and was used to a very large extent by the Dutch cabinet-makers.

Turnings Modern Feature.

The modern adaptations of William and Mary furniture are made usually in walnut and feature largely the turnings which were used in that period. The most familiar of these is the well-known turning embodying the inverted cup. This has come to be a sort of earmark of furniture of this period. When well executed and made true to form, these go to make up prices that are very attractive.

A glance at the accompanying sketches will show that there is a wealth of material, for our modern designers, in the furniture of William and Mary. The twist turnings are supposedly a feature of the Jacobean style; yet here we have a beautiful walnut cabinet, in true William and Mary style, with twist turnings. There is this difference, however, the Jacobean twist is usually slender and the same size from top to bottom, while the William and Mary twist tapers. This is shown clearly in the illustration, the original of which is in the possession of The Thornton Smith Co. of Toronto.

Comparison of Modern Design.

The chair and the sidetable include the more familiar turnings. The chair is influenced strongly by the Flemish style. It has cane seat and back and carved oak frame. The sidetable is in veneered walnut and is typical of the furniture of that time.

Would one be safe in saying that many of our modern adaptations are an improvement over the old designs? Take the two tables illustrated in this article. The higher table shows a typical William and Mary design while the other table is a modern adaptation. In proportion, daintiness of line, detail and general attractiveness the latter piece compares more than favorably with the earlier design.

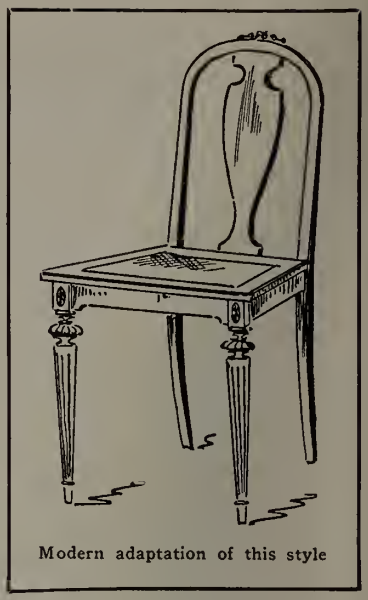
By F. G. Fry



Modern adaptation of this style

The style of art and architecture known as the Louis XVI. was developed by the French in the early 50's of the 18th century, during the latter part of the reign of Louis XV. It was at this time that the buried cities of Pompeii and Herculaneum were first being excavated and the whole art world was influenced by the many classic treasures which were unearthed.

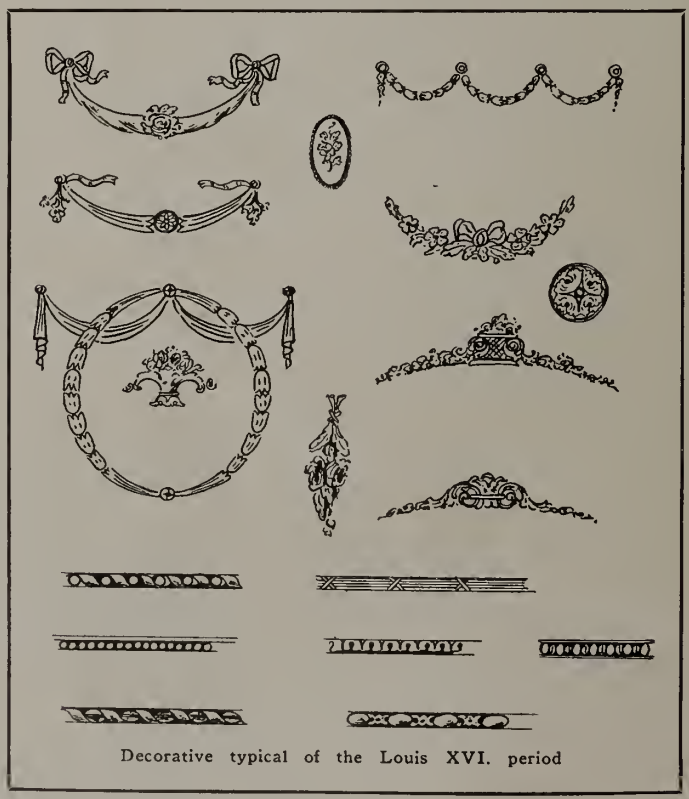
The demand for something different existed at that period, the same then as it does to-day. This newly-discovered art met with ready approval. Mme. de Pompadour, the king's favorite, was in a marked degree responsible for the popularity of the new art in France. She, being a lover of the beautiful and of an artistic temperament, foresaw the possibilities which lay in the classical lines of the new treasures and had several rooms of the palace re-decorated and special furniture made carrying out the inspiration and character of the rediscovered style.

Rococo Style Passes

The popular interest for this type of decoration increased and the designers and artisans of the time began to substitute its simple and quiet lines, in all branches of art, for the flourishing and unsymmetrical curves of the Rococo or Louis XV. style, which had been the prevailing design in art of the day in France.

It was not until during the reign of Louis XVI., who ascended the throne after the death of his grandfather, Louis XV., that the new style reached its highest state of development. Therefore it became known as the Louis XVI. style.

During the French revolution art, as well as most everything else, was destroyed, but the love of the French for fine things would not be downed. The enthusiasm for the designs in furniture and the forms of decoration for which the Louis XVI. style was responsible was carried on into the reign of the Emperors and, with modifications, became known as the Emperois or Empire.



Decorative typical of the Louis XVI. period

Some of the Features

Furniture of the Louis XVI. period is readily recognized by its straight classical parallel lines and carvings. As we are dealing only with furniture we will confine ourselves to its characteristics, entirely. The legs are usually turned and fluted. Sometimes plain turned, with carvings of drops or swags draped around them. The flutes are occasionally filled with quills or bell flowers. Beading on the posts, around drawers and panels is another characteristic feature.

The carvings, which are used freely, include flowers, leaves, floating ribbons, bow knots tying flowers, festoons of flowers and leaves. Vases filled with flame flowers, fruits or a pine cone serve as a form of decoration. Carvings of different musical instruments, such as the flute, pipe, drums and lyre are used.

Marquetry and Inlaying

Marquetry or inlay with woods of various colors is employed, to a certain extent. The objects inlaid are the same as the carvings, and make a good treatment for panels. Hand decoration or paintings of nature studies and scenes are used on plain silk coverings for upholstered goods, as well as on wood and surfaces.

Wedgewood cameos are sometimes encrusted on drawer fronts and panels. These are found mostly on enameled goods. Mouldings are a great decorative

Designs of legs for Louis XVI furniture

factor. These are either plain shaped or of the pressed or carved variety, which include conventionalized flowers, leaves, twisted ribbon, reeds cross tied, a series of pearls or beads and combinations of these various features

Mahognay and Walnut Popular

The woods commonly employed in producing Louis XVI. furniture are mainly mahogany and walnut, finished in their distinctive finishes. A great deal of the more decorative furniture of this style is gilded and enameled in light shades of grey, green, blue, cream and rose. The most popular enamel finish, today, is old ivory with the carvings and metal trimmings decorated in colors or antiqued. The enameled furniture is usually placed in bedrooms, sunrooms and breakfast nooks. For enameling it is not necessary that mahogany or walnut be used, but any hard, close-grained wood, such as birch, that will not show a figure through the finish, may be utilized.

The metal pulls and other trimmings are suggestive of the decoration used and are finished in bronze, antique gold and silver or any other finish that the designer thinks will suit his product or that is typical of the style and blends with the finish of the furniture.

Handsomely Decorated Coverings

Silk damask, figured cretonnes, and tapestries featuring the decorative subjects together with velvet velours, plain or figured are correct coverings for Louis XVI upholstered pieces. As stated above hand paintings of characteristic subjects on plain silk of heavy texture and light colors are used for chair and sofa backs and on cushions of the more elaborate pieces of this style.

In the above article I have tried to bring out the distinguishing characteristics of our modern adaptations of the Louis XVI. style so that when one man sees furniture in this design it will be recognized and when one hears this furniture described one will have a proper conception of its appearance. The illustrations shown will help in this regard.

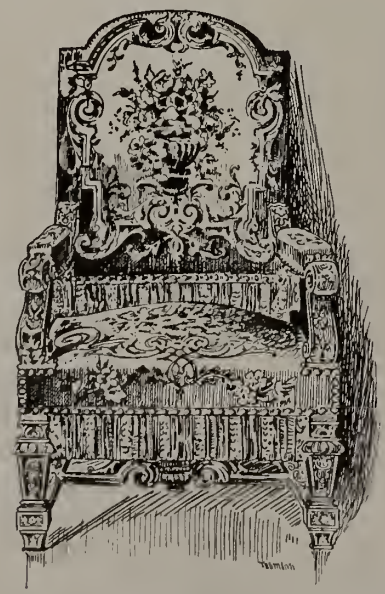
1643—In the Days of Louis XIV—1715

Greater Attention to Design and Decoration—Marquetry Executed by Andre Charles Boulle very Popular—How This Form of Decoration is Worked Out

By H. L. D.

An important chapter in the history of furniture-making is formed by the three styles known as Louis XIV, Louis XV and Louis XVI. The furniture of the Louis XIV period was characterized by bold effects, good execution and lavish decoration. That of Louis XV was of the rococo school when beauty of detail and excessive ornamentation were considered of greater importance than balance and proportion, while Louis XVI marks a return to simpler designs and a more restrained use of ornament.

The ascension of Louis XIV to the throne is said to have marked a new era for decorative arts in France. The monarch and his followers, including the nobility, went in for fine arts and luxurious surroundings. Every encouragement was given to artists, artisans and skilled craftsmen of all kinds, with the result that the furniture, decorations and furnishings of that period were raised to new high levels and skilled craftsmen were classed with artists and sculptors. Vast sums were expended for specially-designed furniture and interiors, and the more distinguished cabinet-makers of the day worked under royal patronage. A large part of the furniture produced was destroyed during the revolution but enough remains to show the trend in style and design.



Beautiful example of Louis XIV chair before curve leg became feature

Buhl or Boulle Marquetry

Probably the most distinguished cabinet-maker of that period was Andre Charles Boulle. He was a man of many talents, artist as well as craftsman, but his fame rests chiefly on a unique form of marquetry, now known as Buhl or Boulle, inlaid in brass and tortoise-shell which he used extensively.

Furniture made by Boulle was often ornamented by massive mountings of gilt-bronze. Many of the Louis XIV cabinets and other pieces were ornamented with figures in light relief,—birds, scrolls and ornamental mouldings standing out from the decorated or boulle surface.

The process used by this craftsman is not generally known or appreciated by the modern cabinet-maker, so that a brief description of the method followed should be of general interest. The design is worked out in detail, full size, from the original sketch, upon a sheet of tortoise-shell, which had been made ready. Such portions of the design as were to be worked in brass, were cut out. The same idea was followed on the brass, the design being worked out and the brass cut away where the tortoise-shell was to appear.

The sheet or tortoise and the sheet of brass, thus prepared, were pressed together. If the work had been

done accurately the pieces should fit snugly together, making good tight joints. A heavy solution of strong glue was brushed thoroughly into the crevices or joints between the brass and shell and then a piece of paper was laid on one side and the work placed away to dry

Louis XIV chair showing transitional period.

and set. When hard, the inlaid piece is laid on the foundation and the paper cleaned off. The boulle work is now ready for scraping, rubbing and polishing.

The engraving of this surface is one of the most delicate and important parts of the work. The design is, to use a technical term, "blind," until the skilled hand of the engraver gives it life and form. When the engraving is completed, a black pigment, like thick ink, is rubbed into the lines left by the engraving tools, thus bringing up all the details of the design.

Boulle work may be done in black, red or brown, and at times it is enriched with other colors, as blue or green. This colored effect is usually secured by coating the surface underneath the veneer, allowing the shade to show through the lighter portions of the tortoise-shell. Sometimes the shell was lined with gold leaf, thus securing a very beautiful effect. Some of the designs worked out were very elaborate and intricate.

Gradual Change in Style.

In the early part of Louis XIV's reign, the style of furniture was influenced by that which had preceded it. The acanthus leaf, executed in low relief, was the other form of decoration. These features, however, underwent a gradual change, so that toward the latter part of this monarch's reign, endless foliation replaced the severer handling of the acanthus leaf and the furniture produced conformed more closely to the rococo outlines.

The woods in demand at this period were chiefly ebony, walnut and with such rare species as sandal, tulip and kingswood for panels to give color and variety. Onyx, porphry and lapis lazuli were resorted to, to embellish some of the richer articles and the whole ornamented with ormolu frames and mounts. This form of ornamentation was carried a step further during the reign of Louis XV.

The accompanying illustration shows a very fine example of a Boulle (Buhl) table; really a museum piece. This table is on display on the floor of Irwin's Limited, Montreal, P.Q.

George II	1727 to 1760	—Chippendale's work about 1754
George III	1760 to 1820	Hepplewhite's work about 1789 Work of Robert and James Adam about 1790. Sheraton's work about 1791 "Louis XVI"
George IV	1820 to 1830	"Colonial" in America strongly influenced by English, especially by Queen Anne Style.
William IV	1830 to 1837	
Victoria	1837 to 1901	"Empire" "Early Victorian"

Personal Element in the Furniture Factory

Knowledge, Initiative, Tact and Character as Important as Modern Equipment, Good Buildings and Efficient Men

By Furniture Manufacturer

IT must often have been noticed even by the most casual observer, that in the furniture manufacturng, as in many other lines of endeavor, one firm is successful, and another fails; that one concern always appears to be busy and prosperous, whereas some other is continually in "hot water." It is the purpose of this article to try and point out one of the reasons of this discrepancy, and to show why in some cases at least, where the same amount of capital is invested, the same physical conditions such as plant, buildings and location are enjoyed, that a great difference in results is experienced because the head of the concern, in one case, is a good one, and in the other case is not, or in other words, because of the difference in the personality of the management.

So far so good, few will dispute what has been said, the evidence on all sides is too obvious and too conclusive, and so in order to be of any practical use it will be necessary to indcate a few of the qualities which constitute a "good head," and how they may be cultivated.

Knowledge is Power

In the first place he should have knowledge, that is, knowledge of his business. The manager or head of a furniture factory who does not know the difference between and differing properties of vegetable and animal glue, that cannot tell by looking at it if the oak he buys is soft and easy to work, or hard and liable to check, that has not acquainted himself with the advantages of the moist air system of drying, as opposed to the hot blast system, and so on, is handicapped on the technical side of his business and should take steps to improve himself. Something that may be done by any intelligent man in a few months. So in the practical part, if he does not know what a machine is capable of doing, or how veneer can be laid in the best manner both with regard to matching, taping and jointing, as well as in the actual pressing; or the actual saving of say a compressed air rubber, over hand rubbing methods, he should do his best to improve his knowledge in this respect. Something that will take longer and require more persistent effort than acquiring technical knowledge—and perhaps not quite so vital as he can depend more upon his superintendent for this end of the business, and he will be well repaid.

Knowledge of the commercial side of his business, comprises knowing what and where to buy. What, where and how to sell. Experience, to some, is a teacher of these things, but common sense and good judgment are essential and, unfortunately, are harder to acquire. However, as it is the writer's wish to say something helpful, he would suggest that price lists of lines bought or likely to be bought be filed carefully for ready reference, that future conditions of the market for all these lines be carefully considered at regular intervals, that probable requirements of all principal lines of purchase be estimated periodically and so forth. As regards the what, where and how to sell, while this is of first and vital importance, it is so much a matter of judgment and varies so much with different circumstances that it is hard to point out to the admittedly inferior manager, if there be such, just what to do, beyond a suggeston, that whatever lines he makes, he makes them well, that he sells only reputable, reliable firms and that he depends upon the merit of his goods, and their suitability to his market more than upon price cutting to his customers or large commissions to his salesmen.

Now I find that this is an immense subject which I have tackled and so far I have only spoken of knowledge as one of the necessary qualifications in a manager of equal and of even greater importance. Many a manager has all the necessary knowledge without being an unqualified success. Integrity—or dependability is more vital. Initiative—or progressiveness— is as vital. Tact, and the ability to inspire confidence, both in his customers and his employees is also essential, and also character, comprising courage under difficulties and self-restraint in prosperity is indispensable to the really successful man.

Dependability.—Do you know of a firm of which it is said by the trade, "their goods give us no trouble," "they keep their promises of shipment," "they never misrepresent," "their correspondence is prompt," "they never sell 'retail' and so on?" If you know such a firm the chances are that you know of them as being fairly prosperous. Needless to say a reputation such as this is only acquired if the head is a dependable man.

Initiative Very Desirable

Iniative.—"A" The head of one furniture manufacturing concern is always planning "something new," his goods are up to date, his machinery is the most modern, his men are working piece work at big wages, (and his production warrants it), his fire protection is first class, etc. "B." The head of another concern has adopted a policy of "let well enough alone," and "that machine is too good to scrap," etc. It would be a pretty safe bet that "A" will be more prosperous than "B" some day, if not yet.

Tact, and character, are two such intangible, indescribable qualities that to write about them in such a way, in an article like this as to enable any reader to improve his stock of them seems hopeless, but it appears to me that tact often consists of an ability to use one's imagination, to see the other man's point of view as well as your own, and it is certainly the lack of this capacity that has caused many a misunderstanding and disagreement, and consequently the lack of success in furniture factories, as well as other places.

Character, courage, self reliance, persistence, determination and honesty. A firm's success has many a time depended on the amount of character possessed by those in authority. This is so obvious that no more need be said, so I will conclude by quoting from a poet who was perhaps too extreme in his opinion, but who had a nice idea:

"Life is mostly froth and bubble,
Two things stand like stone—
Kindness in another's trouble,
Courage in your own."

Publicity Campaign Gains Momentum

Publicity Work Commencing to Show Results—Retail Dealers Co-operating in Gratifying Manner—Let Xmas, 1920, be Furniture One

By R. G. Wells

Like a ball rolling down a hill, seemingly pushed by invisible hands, gains momentum at every revolution, so the Better Furnished Homes Campaign of the furniture manufacturers, aided by the retailers and the Canadian press, takes on added momentum with each passing day. And it is only beginning. The work which has been done is already showing returns, but fuller effects of the campaign should be felt before many months have passed.

The following extracts taken from letters sent in by furniture retailers, give some indication of the attitude of the average dealer:

> "We will surely make a point of running an advertisement along similar lines with each appearance of the Home Furnishings Bureau's ad. We have had many people speak of the opening announcement, and think that in a very short time we will feel good results from this campaign."—Ontario Furniture Co., Ltd., London, Ont.

> "We are very much impressed with the magnificent advertisements which appeared in the "Herald." The educative talk in these ads was good and could not help but be suggestive to anyone contemplating home furnishings. We intend to run special ads. in connection with every appearance of your advertisement." —Nova Scotia Furnishing Co., Limited, Halifax, N. S.

> "We believe this advertising will benefit the local trade considerably."—Harris & Barry, Limited, Ottawa.

> "We realize that this campaign will benefit all furniture retail dealers, and intend to take full advantage of it. We wish to express our appreciation of the fact that this campaign is designed and carried out to help us sell more and better furniture." — Echenberg Bros., Sherbrooke, P. Q.

> "We greatly believe in your campaign and as dealers will co-operate with you in your splendid advertising."—Crown Furniture Co., Limited, Quebec.

One of the most gratifying features of the work is this attitude of the retail dealers and the way they have fallen in with the campaign. One would think they had been waiting for some such opportunity. They have not only linked their advertising with that of the Home Furnishing Bureau, but are making attractive window displays in which they feature the campaign slogan and, in some cases, show copies of the advertisements which have appeared, and, in other ways aiding the good work in every manner possible. Letters received from several of the daily papers bear this out. They state that since the advent of the advertising campaign they have carried more retail furniture advertising than ever before.

This co-operation is necessary to the success of the campaign, and it will be fostered and encouraged in every way possible. The Home Furnishings Bureau will soon be prepared to supply advertising copy and cuts to dealers who will make use of them. Later on attractive window display cards and other forms of cards and circulars will be distributed. A number of lectures on "Home Furnishing," illustrated with lantern slides will, probably, be prepared and placed at the disposal of the dealers. A series of illustrated articles, dealing with different phases of home furnishing, has been secured, which will be given to daily and farm papers for publication.

A result, which, probably, was not considered, but which may have a far-reaching effect, is that this move on the part of the Canadian furniture manufacturers has aroused the interest of the American furniture men in the publicity campaign which they had planned. It is anticipated that the American furniture makers will launch a comprehensive publicity scheme in the near future. The effect of this will, undoubtedly, be felt in Canada, for a certain proportion of the advertising will be placed in publications which circulate in Canada, so will, in a sense, supplement the work of the Home Furnishings Bureau.

That the general public are reading the advertising which is appearing is clearly evidenced by the requests for catalogues, booklets on home furnishing and similar information which have been received by the Bureau. These indicate that a buying interest is being aroused. Requests of this nature are answered courteously and complied with, as far as possible, and the writer referred to the retail dealers in their vicinity. In addition, many retailers have written in, stating that they have made sales which were directly traceable to the advertisements which have appeared.

An effort is to be made to create a greater interest in furniture for Christmas gifts. Three large advertisements, carrying a Christmas message, have been prepared, the first of which will appear shortly, as a part of the Christmas campaign. This is certain to have the full support of all dealers. There does not seem to be any reason why Christmas, 1920, should not be a furniture Christmas.

Efficiently Organized St. Thomas Plant

New Labor-Saving Machines Installed—Careful Check of Lumber and Spoiled Work—Special Forms and Jigs—Output Includes Built Up Panels and Phonograph Cabinets

AN organization that bids fair to put St. Thomas on the map, as far as the woodworking industry is concerned, is the St. Thomas Cabinets, Limited, of St. Thomas, Ont. This concern, which is backed and guided by tried and tested business men, has been in existence only about twelve months, yet has succeeded in what is known as "making history."

Only a short year and yet much has been accomplished. A suitable plant has been procured, equipment purchased and installed (with deliveries as they are, no small task in itself), an efficient organization

An "American" planer installed in the St. Thomas Cabinet's plant.

got together and trained; cost-finding and factory systems installed; patterns, jigs and forms made and production entered on on a large scale. As an example of the difficulties with which they had to contend, production was being held up due to the slow delivery of a glue spreader, which had been ordered. What did the manager do but board the train for Rushville, Ind., spend several days there hastening the completion of the machine, and then brought it back with him by express. It cost over $400.00 for express, but saved many weeks of valuable time.

The equipment installed is new and modern, embodying the latest ideas in woodworking machinery. Most of it was selected from the well-known line of "American" equipment (American Woodworking Machinery Co., Rochester, N.Y.) which is handled in Canada by the Garlock-Walker Machinery Co., Limited, of Toronto. Some of the principal pieces installed are an American No. 25 straight edging saw, 3-drum endless bed sander, No. 4 band resaw, 36-inch. planer with divided rolls, 2-spindle shaper, 8-inch moulder, tenoner and other smaller but none the less necessary machines. In the cabinet room the equipment consists of a Jackson-Cochrane revolving clamp carrier, 3 belt sanders and a drum sander.

It was found that owing to the difficulty experienced in securing satisfactory deliveries of veneers and panels, the most satisfactory way of insuring a dependable and adequate supply of this material was to equip a veneer department and manufacture their own. Accordingly a panel plant, consisting of a Jenkins veneer jointer, a Preston (Black Bros.) veneer taping machine, Farquhar hydraulic press, Francis glue spreader and Capital veneer cutter, was installed. This plant gives a daily output of about 2000 ft. of 3 and 5-ply material. Perkins vegetable glue is the adhesive employed in this department. This output is greater than their requirements so they have been disposing of the surplus to other panel users.

The lumber for the core stock, posts and mouldings, is all thoroughly seasoned before entering the breaking-out department, the drying being done in a Sturtevant compartment kiln. A Powers regulator was recently installed to automatically control the temperature in this kiln, and needless to say it is giving every satisfaction.

Lumber Carefully Tested For Dryness.

The stock is dried down to a moisture content of 4%. It may be of interest to note that in testing the lumber, the core and outside or shell are tested separately. They must both show the same moisture content before the material is taken from the kiln. This is an excellent idea. As explained in an article which appeared on page 49 of the March "Canadian Woodworker," a piece may have an average moisture content of 5 per cent. while the centre section itself might contain as high as 15 per cent. moisture. If such a piece were to be run into mouldings for phonograph tops or similar work warping would certainly ensue.

Another advantage of this method of testing is that should a test show too great a variation between the

core and shell, it would indicate that the air in the kiln was too dry, causing the outside to dry too rapidly. When this condition is found to exist, to prevent checking and case-hardening, the humidity of the kiln is raised. If the difference is very great, the stock might be subjected to steaming for a short period.

A careful check is kept on all lumber used. The material required for a part or any number of parts is known. Checking the amount of lumber required for a certain number of pieces against the number of feet brought in and cut up, gives the amount of wastage. This is carefully noted on the stock bill. All lumber is brought in on requisitions which are issued bearing the shop order number, covering that particular requirement. A lumber book is kept in which is entered all lumber received and all lumber billed into the factory. This serves as a perpetual inventory and gives at a glance the number of feet on hand covering any particular item.

Close Check on Spoiled Work.

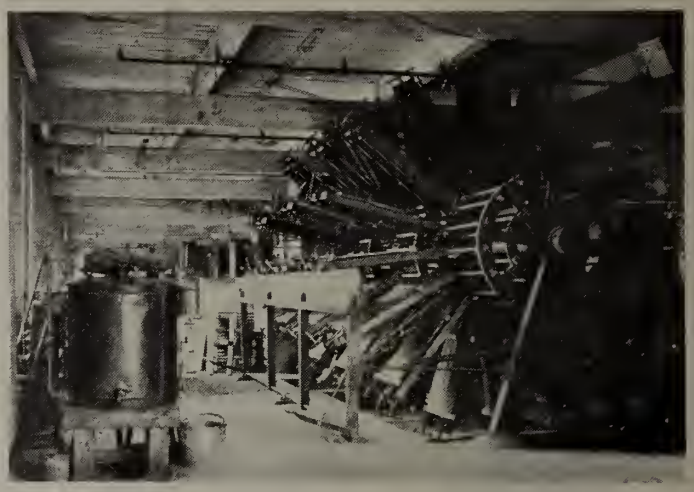
A close check is also kept on all material spoiled in process of manufacture. The different parts are checked between each operation. If some are missing or have been spoiled in the preceding operation, the trouble is located then and there. All parts for replacement can only be made on a special job order signed by the manager. This close check tends to prevent careless work, as a workman knows that he will have to account for all pieces lost or spoiled.

As soon as production was well under way, an exceptionally close check was kept on the individual cost of each part and even of each operation. This information was worked out into a set of what might be termed standard costs. These figures are used to check the costs on all succeeding orders. If the variation from basic cost is very marked, an investigation is made to determine the cause of the difference. Piecework is used to a limited extent. It has been found to work most satisfactorily. Production has been increased and the percentage of overhead lowered where it has been placed into effect.

Jigs and special forms are resorted to wherever possible in an effort to increase production, and at the same time keep manufacturing costs down to a minimum. Thus they have special forms for clamping up the covers and glueing up the gables and cases. Where edge veneering is required on the tops, the work is done on the revolving clamps. Forms are also used in the machine shop for such operations as shaping posts, sanding the back of cover mouldings and other similar work.

Modern, Well Lighted Factory.

The factory itself is a modern brick building containing about 80,000 square feet of floor space. At the present time only about 38,000 feet of this is utilized for the making of phonographs. As the volume of business increases, more of the space will be taken over. The building is long and comparatively narrow. This means that each floor is well supplied with natural light. The lower floor, where the machinery is installed, is a concrete floor which facilitates the move-

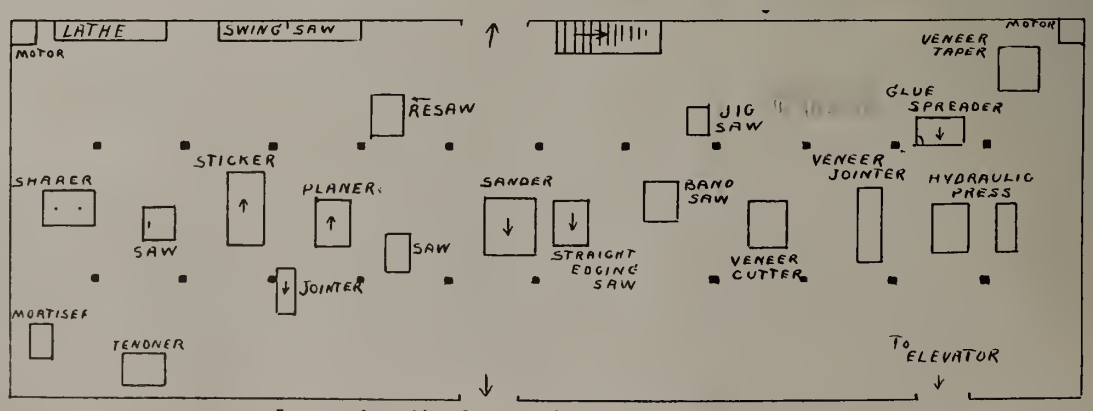


Jackson-Cochrane glue clamp in St. Thomas plant.

ment of stock by factory trucks. The shavings and sawdust are removed by a shavings exhaust system installed by the Toronto Blower Co. The fire risk is reduced to a minimum by an efficient sprinkler installation. About 135 men are being employed and the daily output runs around 40 complete cabinets as well as a number of built up panels.

The personnel of the St. Thomas Cabinets is as follows: B. F. Honsinger, president; Joseph Bone, vice-president and general manager; J. B. Woodhouse, secretary-treasurer; P. A. Honsinger and A. A. Ingram are also on the board of directors. Harry Woodhouse, who had charge of production at the Canadian Aeroplanes, is looking after this important phase of the work.

The automatic saw grinding machine saves the hand sharpener a lot of tedious work.



Layout of machine floor showing arrangement of equipment.

How Resaw Troubles May be Prevented

Shape and Depth of Teeth Important—Excellent Results when Properly Fitted—How to Make a Good Braze—Troubles Often Encountered

By P. E. Poole.

One of the more important points in the care and fitting of a band resaw is the shape, depth and spacing of the teeth. The teeth should be as short as possible and yet have room to chamber the sawdust. This will add to their strength and prevent their vibrating in the cut. A long tooth is sure to tremble when at work, and thus do rough sawing. The spacing of the teeth depends entirely upon the width of the material sawn and the feed carried. In resawing narrow strips a fast feee is carried, and fine-spaced teeth may be used. For general purposes teeth 1⅝ inches from point to point give a very good service. An 18-gauge saw may have teeth ⅜ of an inch deep; 19 and 20-gauge 5/16 inch; thinner than this ¼ inch or less. In filing the band saw the teeth must be of one length, so that each does its share of the work.

It is advisable to use a swage. The form of the swaged point is very important. The only part of the band saw blade which should come in contact with the material sawed must be the cutting edge, and this cutting edge should have clearance both in the direction of the feed and in the direction of the descent of the saw blade. Hence the swage used must form the tooth broadest at the extreme point. Otherwise the tooth must be side-dressed by hand or a pressuer side-dresser used. In fact, this is a good tool to use in any event, as by its use the swaged portion of each tooth may be brought into perfect shape. Do not use a side file.

Automatic Grinder Best Tool.

In filing, an automatic emery grinder should be used, as it will be found a tedious operation, where much resawing is done, to fit the saw blades by hand. It is also difficult to avoid square corners and if these exist fractures will be apt to start from them. The grade of wheel selected for the grinder should be given careful consideration. A hard emery has a tendency to burn the ends of the teeth. This results in a loss of temper or hardness and means that the tooth will not stand up or stay sharp as long as if the temper had not been drawn out.

It is probably unnecessary to say anything further about filing, other than to state that it is very essential, after the saw is filed, to examine each tooth and see that it stands perfectly straight, and that it has a perfect swage, namely sharp, keen corners with perfect clearance. If this is done the thinnest saw can be made to resaw perfectly the widest material. The saw blades will also be found to run a long while without resharpening, and, in short, any extra pains which are taken in fitting the band resaw blade will be repaid tenfold, both in quality of work done and in the quantity turned out before resharpening.

Troubles Often Encountered.

The matter of the setting, that is, the form of the swage, giving each tooth a keen cutting edge, and of keeping the saw straight in the back, are the most often overlooked, and these conditions have caused the users of band resaws a great deal of annoyance. In conclusion, finish up the fitting of the saw blade before attempting to run it.

The cracking of band saw blades is caused by some of the following conditions from overstraining or from vibration. Vibration may arise from any of the following causes: if the face of the wheel is out of true; if the wheels are out of balance; if sawdust and gum accumulate on the face of the wheels; uneven tension hammered in the saw blade. Then, too, the saw may be crystalized from too heavy blows with a hammer or from using sharp-faced hammers, or from the swage

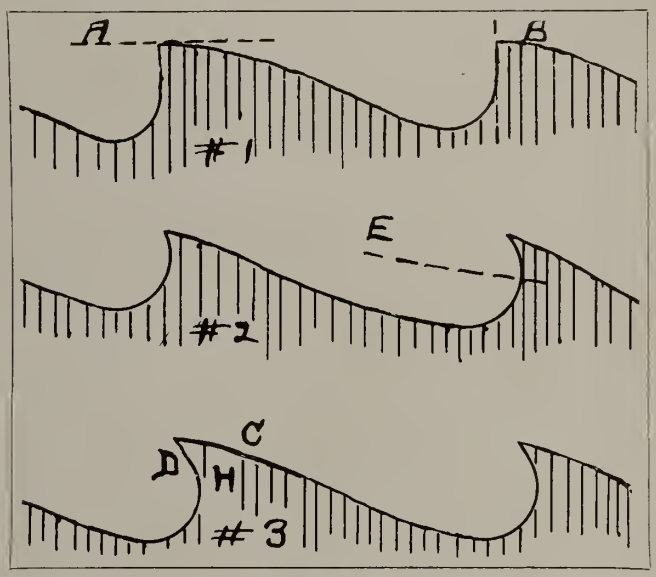


Fig. 1—No hook, rubs on back. Fig. 2—Not enough metal, weak tooth. Fig. 3—Good shape, plenty of hook.

of the tooth being of such form as to crowd the saw against the guides. The saw will also vibrate from insufficient strain. It is necessary that as near an even strain should be maintained on the saw blade as possible.

Hanging the Saw on the Machine.

See that the upper and lower wheels are adjusted one in line with the other. Place the saw blade in position, the teeth only projecting over the edge of the wheel. Raise the upper wheel and provide the proper strain for the saw blade. Turn the wheels slowly around by hand and train the saw so that it will maintain the proper position, namely, the teeth projecting half-inch beyond the face of the wheel. Do this by tilting the upper wheel. When the proper adjustment has been made, secure the shaft in this position and do not further adjust it vertically (i.e., tilt) so long as you have this saw in use.

As the saw blade becomes full or tends to crowd back on the wheel, counteract this by the use of the cross-line lever. This latter must not be abused, however, as a very slight adjustment is sufficient, "and the saw must not run in a twist." If the pitch or hook of the teeth is suited to the work done, and if the saw has been hammered or rolled to the proper tension, it will maintain its position firmly on the wheels with little or no use of the cross-line. A pitch or hook of the teeth which gives good results is about 5 inches to 12 inches in width of the saw.

The ends of the saw blades are first prepared by

filing a true taper, commencing back about ½ inch from the end and filing the saw thinner as it approaches the end, at which point it should be only the thicknes of a knife-edge, one end of the saw being filed from the outside and the other from the inside. This being done the saw should be placed on the brazing table, the back edge being brought abainst the back of the brazing table. This forms a straight-edge, and will bring the saw blade to a straight line. Now dust some powdered borax on the under edge of the saw blade, and after cleaning a piece of silver solder of the proper size slip this between the ends on top of the borax. Dust some borax as well on the silver solder. The saw now being in proper position, the ends lapping ½ inch, the brazing irons should be slipped one over and one under the saw, and the screws adjusted so that the saw blade, when clamped, lies in a perfectly level position. Now withdraw the irons, only loosening the screws enough to allow this and no more, heat the irons to a cherry red in a clean fire, again place them in position, and by means of the clamping screws firmly bring them to bear upon the saw blade. Leave in this position until cool, when the saw may be removed and the joint dressed and hammered the same as the rest of the blade.

Some filers prefer to use muriatic acid in place of borax; the effect is the same.

Getting Best Results from Saws

When a circular saw does not give satisfactory service the first thought is to lay all the blame on the manufacturer—especially if the saw is a new one. When this is done, the operator feels that he is relieved from all responsibility, so seldom makes any effort to see if he cannot find and remedy the trouble. An instance of this kind came to the attention of the writer not long ago in the case of a woodworker who had just

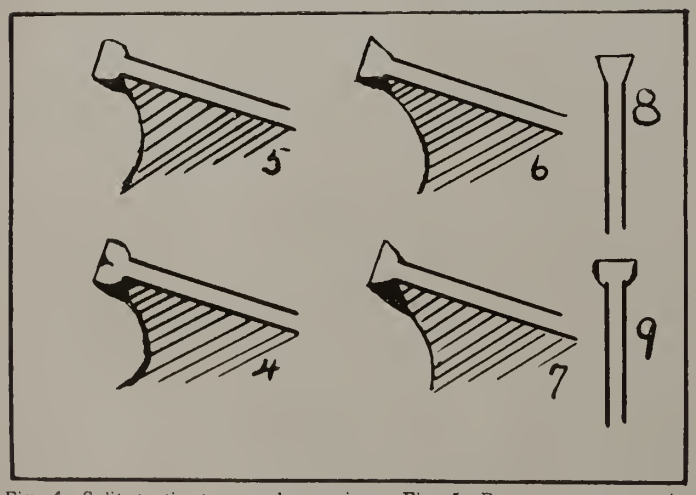

Fig. 4—Split tooth, too much swaging. Fig. 5—Poor shape, rounded corners. Fig. 6—Properly shaped and swaged. Fig. 7—Swaged too deep. Fig. 8—Keen cutting, excellent shape. Fig. 9—Poorly shaped and dressed.

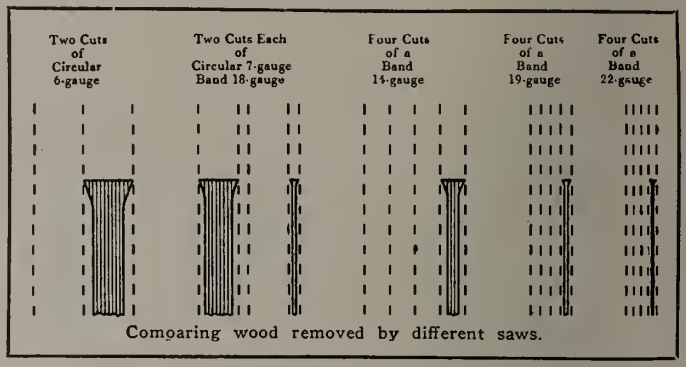
received a new circular resaw. The saw was looked over and put on the machine and then the trouble started. It would not seemingly make a true cut. It snaked, wabbled, burned, in fact it did about everything that a circular resaw should not do.

Naturally the saw itself was at fault and a hurried call sent to the manufacturer. An expert was rushed out from the factory and about the first thing he noticed was the way the saw was swinging. To produce that high note, it must have been going at a good rate of speed. The speed was tested and found to be about twice as high as that advised by the makers and the speed at which the saw was designed to travel. Reducing the r.p.m. to normal had the desired effect. The operator of this machine did not know that carrying a speed in excess of that at which the saw was designed to run, affected the cutting qualities of the blade. His idea was high speed, high production.

Another instance of where a new saw failed to give satisfaction was that of another complaint recently



Two Cuts of Circular 6-gauge

Four Cuts of a Band 22-gauge

Comparing wood removed by different saws.

made to a manufacturer. As usual, an investigation was made, for not only do the makers of saws wish to satisfy their customers but by investigating all complaints, a lot of new and valuable information is acquired. In this particular case, the purchaser of the saw had not given any information as to the exact nature of the work to be done, and in consequence the shape of the tooth on the saw sent proved to be altogether unsuitable for the work in hand. If proper information had been furnished in the first place, this trouble would not have occurred. The manufacturers of saws usually know what they are doing, and if consulted and their suggestions followed, the results are usually satisfactory.

Waste

By S. J. Faeder

A small word, but full of meaning; it can do a great deal of harm—in fact, so much harm as to break any business concern where waste continues to go on unchecked.

All of us should immediately concentrate to eliminate waste. The hardest kind of a job given to any of us becomes very easy, with a little planning and thinking of the best ways and means to do this job faster and better, so as to save time—and when you are saving time you are also doing away with waste.

In our own plant, with its many departments and so many hands, each and everyone of us should personally see to it that waste is handed a knockout blow—we can do it and we should do it. Can you imagine the loss, if for instance, one of our cutters should continually cut his covers a few inches too long, or if burlap, muslin, cambric, etc., is cut too large or even too small for any job.

Would you throw away your own money, or flitter away with your own time No honest and sane man would. So why throw away your employer's money or waste his time. All of us are being paid for our work, but none of us are being paid to make waste. Waste means ruin, and no employer could stand it very long.

Let us resolve to eliminate waste in every department, and each and everyone of us see to it personally that this waste should stop.—In Karpen Komment.

Is Enough Attention Given Dry Kiln?

Large Percentage of Troubles Due to Faulty Drying—Scarcity Air Seasoned Stocks Necessitates Improvement in Drying Operation—Method as Important as Kiln Itself—Moisture Content Governs Drying Conditions

By J. B. Mass*

TALKING with different woodworkers one often hears of new and expensive machinery being installed to accomplish certain results and, finally, after it is all done, the old trouble of imperfect product persisting. The cause of all this is, at times, never found out. I sometimes wonder how many times this investigation extends to the dry kilns and the dry kiln operator ? Seldom, if ever, for the simple reason that so few manufacturers know a great deal about what might be termed the very heart of their plants.

How long could a manufacturer of wood products stay in business without drying facilities, and yet how little attention is paid to the proper method of drying. In the good old days, that have now passed, lumber that was air seasoned for from one year to five years was very abundant and naturally was easy to get, but since the war period it has been practically impossible to obtain air-seasoned stock, unless it is seasoned in your own yards. How many manufacturers can afford to tie up their money in stock at the present high costs ?

It seems more logical to me that the manufacturer should install modern drying facilities so as to be able to dry his stock directly from the saw or the car, and at the same time get his lumber out in condition that far surpasses air seasoning and, in fact, puts the wood stock in as near perfect condition as anyone could hope for. It is then very evident that the money tied up in stock can be quickly turned over and a larger volume of business done on a smaller capital.

*Engineer, National Dry Kiln Co., Indianapolis, Ind.

Importance of Efficient Operation

But with all the advantages embodied in up-to-date driers, due to the untiring efforts of the dry kiln manufacturers, it is of little avail unless the dry kiln is under intelligent operation. Let us suppose that in one of the annual speedway events two cars of exactly the same horse-power, weight, etc., were entered, and that some driver who knew his business, (let us assume it is Ralph de Palma), were to drive one car, and that another man, absolutely unfamiliar with a motor car, and least of all, in racing this car, were to drive the second car; on which would you bet your money ?

The same is true in operating a dry kiln. Unless the operator knows his business—when to apply more heat, more humidity, more circulation; how to overcome this and that condition—he most certainly cannot attain the best results.

Now, in answer to this some manufacturer will say: "Why, So-and-So has run dry kilns for years; in fact, his father ran our kilns before he took hold of them; and certainly he must know what he is doing." Yes, he ought to know, if he has kept in touch with recent developments, but it often happens that he has not. Remember that in the past, when your stock

An installation of National Automatic Humidity Controlled Dry Kilns at the plant of the Ford Motor Co., Detroit, Mich.

reached the kiln it was so well air-seasoned that poor operation could not hurt it much any away, and the results were, and could not help but be, fairly good. To-day it is different, as stated before, and the result is that the man who, in bygone days ran the kilns is never suspected of being behind the present trouble. When trouble arises the cause is looked for in other parts of the factory, with the result that thousands of dollars are spent on new manufacturing methods and machinery, yet without sufficient return to justify this expenditure.

Necessary Features in Kiln-drying

Mr. Woodworker, look at your kiln and the operator. Old kilns that are lacking in some of the fundamental drying principles certainly have to be remedied by either remodelling them or installing an up-to-the-minute kiln which contains these principles. These principles, although being but few, in fact, only three, must be such that they follow the laws of physics, and for all of this must be under absolute control of the operator. Right here let us bring up our previous example of the automobile. Suppose we had all the power we wanted, but could not control it. It would be of little avail to have this power if, in emergency, we could not control it. Likewise with the kiln. Besides having the three principles which are necessary, these will not suffice unless we can use them to suit varying conditions.

Getting down to drying, will say that these three fundamental drying principles are: 1. Heat, in sufficient volume. 2. Circulation, and this in the right direction. 3. Humidity, and, besides sufficient humidity, a system that will humidify the whole kiln, rather than just a portion of the kiln.

These three fundamental principles go hand in hand with each other, and, if one is lacking, the other two are of little use. Let us suppose, for example, that we have a kiln which has ample heat, and secondly, that it has a means of humidifying the air, but that the second principle, or the circulation, is lacking. It can be clearly seen that when the heat is turned on it starts the moisture in the lumber to evaporating into the air, and, if this is taking place too quickly, we can control it by applying a certain amount of humidity to the air surrounding the lumber, and thus curtail the rate of evaporation—but air can hold only a certain amount of moisture within itself and this varies at different temperatures. Air with a high temperature can contain more moisture than it can at a lower temperature, and eventually the limit is reached, and it becomes saturated and precipitates its moisture, which falls back in a condensed form on the wall of the kiln, or on the lumber, the result being approximately little drying has been accomplished. If this moisture-laden air can be carried off by means of circulation into the outer air, you can see this is now getting to the point of accomplishing what you want, and that is to get rid of the moisture.

Why Flexibility is Desirable

In selecting a heating system it is a good idea to have the radiation divided into units, so that when a low heat is required it can be obtained by using only a portion of the heating surface, and, when greater heat is required, as the drying progresses, additional units can be applied, gaining the degree of heat required. A humidifying system, with piping divided into units, so that the steam is applied evenly throughout the drying space is considered a good feature. If this is not secured, one portion of the kiln may have ample humidity while the other portions do not get a sufficient amount, which will naturally put drying conditions slightly beyond the control of the operator.

Many will say "why need all this flexibility, as all we are trying to do is to drive some moisture from the wood?" In answer to this, I will say that although this, in general, is what we are aiming to do, at the same time there is more than one kind of moisture to evaporate, and I will try to explain what the different kinds are:

Wood is made up of cells—some simple, some complex; some running in one direction and some in others, depending on their several functions in the life of a growing tree. Some cells are in the living portion of the tree, as in the spring or sap wood; others have passed from the active stage into the inactive, and are now what is known generally as the heart wood. These cells are filled with the tree's excretions, and naturally become harder or more dense the older they are.

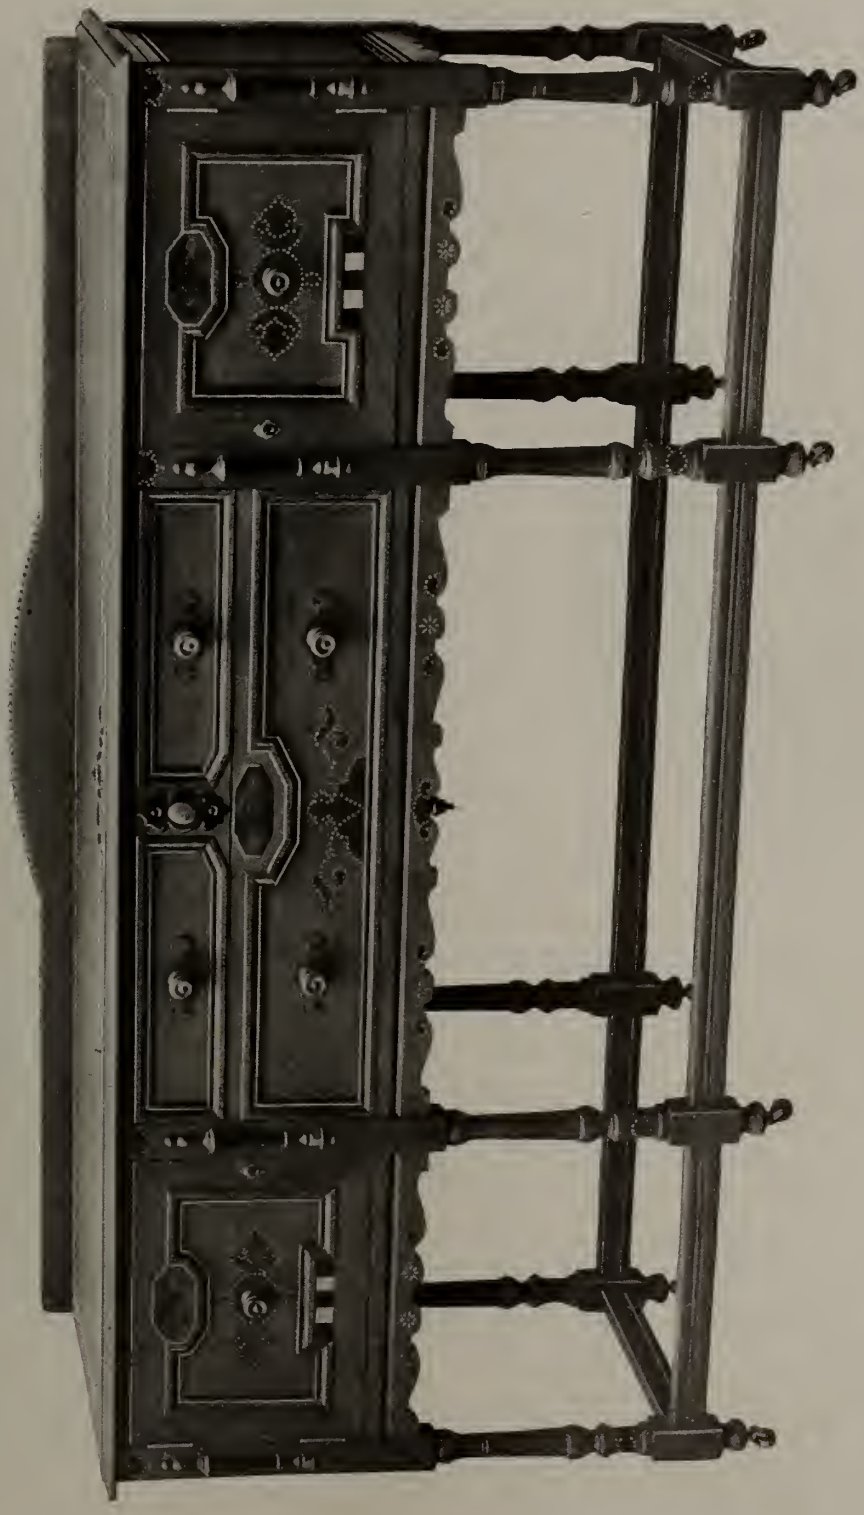
Now, in the cell cavity and in the spaces between the cells we find a liquid or water that is known as "free water," and, secondly, the cell walls, not being solid or compact membranes or tissues, as is generally supposed, are minute particles held together by surface tension with a film of water which is scientifically known as hygroscopic moisture. From experiments, as a rule, that moisture above 25 to 30 per cent. is the free water and below that is the hygroscopic moisture, or, in other words, at about 25 to 30 per cent. of moisture content we get the fiber saturation point.

Moisture Content Governs Drying Conditions

In drying this green wood, the operator must make moisture tests to determine the best conditions under which to start the drying, and at intervals through the drying period he must also make moisture and case-hardening tests to determine what heat, humidity, and circulation to carry at all periods of the drying. After the free water is eliminated and the hygroscopic moisture begins to come off, the result is a drawing together of the cell walls and in the aggregate a shrinkage of the piece being dried.

The operator must know when the water is evaporating too quickly from the surface of the piece for, if in a thick piece of stock the outside dries so quickly that the cells of surface begin to shrink before the free water has passed off from the centre of the piece, the result will be a case-hardened condition, which, if not properly noted, and taken care of by the operator, will result in such heavy stresses and strains taking place in the centre and on the surface of the piece that the fibres in the centre pull away from each other, giving the too well-known honey-combing or hollow-horned stock. Then again, if these conditions are not relieved in the drying before leaving the kiln they will be relieved in succeeding operations, with the result that the lumber will warp and twist out of shape, either spoiling the stock before it gets to the manufactured article, or else, if this takes place after the stock is in the finished article, it necessitates a new part or parts. This runs up the overhead and repair costs.

The installation of an efficient kiln, embodying the points outlined above (or the remodelling of an inefficient kiln) together with careful, intelligent operation, will eliminate much of the expense and worry common to the seasoning and manufacturing of wood.



An adaptation of the Spanish Renaissance style from the line of the Anthes-Baetz Furniture Co., Limited, Kitchener, Ont.

Malcolm & Hill on Quantity Production

Kitchener Plant Specializing in one Line—Canadian Birch Used Almost Exclusively—Advantages of Intensive Production Efforts—Lumber Yard Receiving Special Attention

IT has long been contended that the solution of the production problem in furniture factories lies to a certain extent, in greater concentration on a smaller number of lines—in a word, specialization. Focusing the productive efforts of any organization on a limited range of articles is bound to result in increased output, higher efficiency, lower manufacturing costs, together with a corresponding increase in profits. In the past furniture makers have been working on very diversified lines, and while an effort has been made during the last few years to concentrate on fewer lines there is plenty of scope for further improvement in this respect.

James Malcolm, Kincardine, Ont., Vice-President and Managing-Director, Malcolm & Hill, Limited, Kitchener, Ont.

One of the larger concerns who have organized for the quantity production of a small number of suites of medium-grade bedroom furniture is Malcolm & Hill, Limited, of Kitchener, Ont. This firm, as is well known, recently took over the furniture factory formerly operated by the D. Hibner Furniture Co., Limited. Since acquiring this property many notable changes have been made, the whole plant having been reorganized and improvements made wherever needed or wherever possible.

Design and Quality the Goal

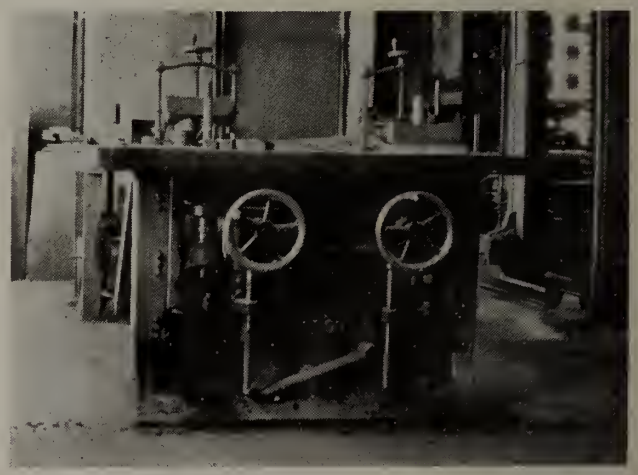
As fast as the orders, which had been accepted for the Hibner products were filled, these lines were dropped. To-day there is very little Hibner furniture going on the market. This switching of output paved the way for centralizing production on bedroom furniture. In addition to dropping the old lines, changes were made in the plant and layout that would facilitate the movement of work in the different departments and increase the efficiency of the whole organization, enabling them to turn out a quality line at a medium price.

For the present the output is confined to bedroom furniture, five suites being produced. The designing of these pieces was entrusted to Stanley H. Stirrup, formerly designer for such well-known firms as Berkey & Gay and The Luce Furniture Co. of Grand Rapids, Mich., now with the Andrew Malcolm Furniture Co., Kincardine. In the resultant product Mr. Stirrup has amply justified the confidence placed in his ability. The suites being produced are adaptations of some of the better-known English period styles, such as Queen Anne, Chippendale, Sheraton and Hepplewhite. The designs, themselves, however, show both originality and individuality. In beauty of form and line, proportion, dignity and general detail, they are a marked departure from the ordinary run of furniture having period motifs. The intention was to manufacture an exceptionally attractive line of medium-grade furniture, and while in this they have been successful the attractiveness of the designs and the quality of the workmanship and finish almost put their product in the same class as most of the high-grade furniture on the market.

Using Native Wood as Foundation

Believing that Canadian birch is the equal of any other wood for the manufacture of furniture, the Malcolm & Hill Co. have adopted birch as the foundation for their line. In this respect Malcolm-Hill furniture is, indeed, Canadian furniture by Canadian workmen from Canadian wood for Canadian homes. This fact is to be emphasized in their publicity work. Where walnut or mahogany veneer is used it is laid on a birch core. The posts, standards, frames and inside construction is all made of birch.

The suites are made in three finishes, viz., mahogany, birch and enamel. The enamel work is usually done on mahogany veneer. This is due to the fact that this furniture is a plywood product (better than solid wood). Most of the birch veneer on the market is rotary cut and is often ruptured and rough. It is, therefore, not suitable for face veneering, especially for a fine finish like enamel. Every attention is given



Preston ball bearing shaper in Malcolm & Hill plant.

to the finishing, both with regard to the shade and quality of finish. Fred. Hansen, who has charge of this department, is an expert finisher, having had many years of practical experience in different American factories where he gained an enviable reputation as an authority on color and finishing.

In reorganizing the plant special attention was given to the lighting problem. Walls and passage ways that tended to obstruct the light and darken the shop, were removed. Paint and whitewash were used liberally to brighten up, and where windows faced other outside walls, such walls were whitened to reflect as much light as possible into the plant. It is remarkable what a little white paint will do toward increasing the brightness of a plant. In this particular instance it seems to have about doubled the lighting efficiency of the factory.

Factory Made Bright and Cheerful

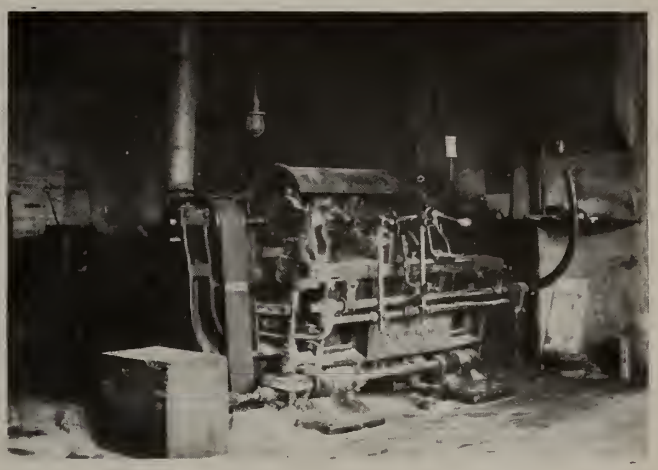
A visitor going through this plant could not help but notice the bright, cheerful aspect of every department. The windows are clean and free from obstructions, the walls white, the floors scrupulously clean and even the different lines of pipes have not been overlooked, red having been applied to the sprinkler system and the other lines painted another color. All this is not for appearance only as it has its effect on production. The workmen having a bright, cheerful place in which to work, are more contented, take a greater interest in their work and are, therefore, in a position to produce more.

The factory organization is under the guidance of S. H. Maxwell, late of Grand Rapids, Mich. Mr. Maxwell was with the Berkey & Gay Co. of Grand Rapids, for twelve years, and before that was with some of the well-known British furniture men. Thus he is admirably fitted for his present position. The practical knowledge gained in other centres should stand him good stead in maintaining his department at its highest point of efficiency.

At the present time the output is in the neighborhood of twenty complete bedroom suites per week. This will gradually be increased until a capacity pro-

Yates edging and jointing saw in Kitchener plant (one of two)

duction of fifty suites weekly is reached. At that time employment will be provided for about two hundred hands. These suites are put through in lots of twenty-five or fifty, and sometimes larger, thus taking advantage of the unit system of quantity production. Confining the output of a plant to a limited number of lines has the following advantages: Less time is lost in changing machines from one operation to another; few changes are necessary; not as many different parts to look after, the men become accustomed to and expert in, the different operations expected of them, and special opportunities are afforded for the use of time and labor-saving jigs and other special tools. Another feature is that advantage can be taken of straight line production in the arrangement of the equipment. This is a big thing in itself for it means



Mattison automatic turning lathe in Malcolm & Hill factory

that workmen are actually able to produce more with less effort and at less expense.

Special attention is being given at the present moment to the lumber yard. A series of tracks are being laid and when the installation is completed practically all the lumber in stock will be carried on kiln trucks. This effects a considerable saving in handling costs as well as reducing the loss from breakage. The lumber will be taken from the railway car into the yard, through the kiln and on into the breaking-out room without any re-handling.

The men behind this company are well-known in their respective fields. The president is Edwin A. Hill of the Toronto Plate Glass Co., Limited, of Toronto, while James Malcolm of the Andrew Malcolm Furniture Co., Limited, of Kincardine, Ont., is the managing-director. The secretary is J. H. Kennedy. The other directors are S. J. Sutherford and Bryce B. Hunter. The business-like way in which the above men have gone about the organization of this company and the reorganization of the plant, and the up-to-date methods being followed, auger well for the future success of this young industry.

Should Tenon be Sawed or Cut

We have always used saw-like score knives on tenoning machines to make the shoulder. In making tenons by hand we have nearly always used the saw on the shoulder, and of late years have resorted to the saw quite freely in cutting out the tenon body itself. Now there is offered a choice between the regulation cutterhead tenoner, and tenoning machines using saws both for the shoulder and for cutting the tenon itself.

When you stop to think of it, the saw seems the logical tool with which to cut the tenon. True, to get smooth work takes careful fitting of saws, and there is the question of adjusting the pair which make the tenon so as to get the exact thickness desired. This, however, should really be easy in comparison with the skill and patience required in grinding and fitting knives on the regulation cutterhead for tenoning.

What of the Hardwood Lumber Situation?

Is Last Summer's Market Likely to be Repeated—Delayed Buying Responsible Then, To-day Few Orders Being Placed—Stocks Below Normal with Low Production—Firmer Prices a Probability

IN the Annual Furniture Number of the "Canadian Woodworker," published in November, 1919, we gave a comprehensive outline of the hardwood lumber situation and suggested that our readers estimate their requirements for 1920 and buy sufficient lumber to cover. That advice was good, and those who acted on our suggestion saved money. Prices of the various hardwoods have apparently struck rock bottom, and the next movement will be upward. To those who find their stock running low or who have been waiting for rock bottom prices, we suggest that it would be good, sound business to purchase now. Conservatively estimate your requirements for the coming six months, or year, and enter the market before the demand picks up and prices stiffen.

Last year unfavorable weather conditions held up production so that stocks were well below normal. Buying was not general because lower prices were anticipated. When the demand did revive, there was not sufficient material to go around, with the result that buyers were bidding against each other and values were inflated out of all proportion. Delayed buying was one of the prime causes for the high values which prevailed in the lumber market.

Very Low Production

This fall all buying has stopped, the demand having fallen off to such an extent that many mills are closed down, while others are operating part time, and production is being curtailed right and left. On the other hand stocks in the different yards are not large. Some mills have large quantities on hand, while others are carrying only about 40 per cent. of normal. The lumber in the hands of the various mills in the Southern producing centres is estimated to be about 70 per cent. of normal, with production down to 30 per cent. of normal. Conditions in the Northern producing areas are very little better. Another bad feature is that logging operations are being curtailed so that when the demand revives as it is bound to do, there will not be a reserve supply of logs available from which to replenish the depleting stocks.

It is felt, by those who are in touch with the situation that prices have reached their lowest ebb. The average reduction from peak prices prevailing last spring, figure about 50 per cent. Many items are selling at and even below the cost of production. As the majority of the stocks are in strong hands, it is not thought that any further price concessions will be made. Again, it stands to reason that lumber manufacturers will not continue to cut lumber from which they cannot realize the cost of production.

Walnut is probably the strongest item on the list. This is due to the fact that walnut prices were not inflated to such an etxent as certain other woods and also because there is a fair demand for this lumber from the furniture industry, export buyers and manufacturers of interior finish. The walnut stocks in the different yards are large and well assorted. This is due to the lessened demand. However, the quantity on hand is not abnormally large and an increase in buying would tend to speedily deplete it. The supply of walnut logs is low, being about 20 per cent. of the quantity on hand this time yast year. Owing to the fact that the manufacturers have large stocks in their yards, the production of walnut logs has practically ceased.

Walnut to Hold Firm

The present market prices of this wood are likely to hold. Practically all walnut mills are in a position to carry the stocks they have and as the production of logs has stopped, there is not much likelihood of an over-supply. Thus it will be seen that walnut is in a fairly strong position.

Oak and Gum are not so favorably situated. The demand for these woods is at at very low ebb. Production is being curtailed in the wood as well as at the mills. With production about 25 to 30 per cent. of normal and a large proportion of the mills closed down indefinitely and an absence of buying, these woods are in a very weak position. Available stocks are well below normal, being about 65 or 70 per cent. of the quantities usually in the yards at this time of the year. With prices at or near the cost of production, and the majority of mills closed down, rather than operate at a loss, it would appear as if the lowest point in lumber prices had been reached. Prices may not revive immediately, as that depends on increased buying, but it is a foregone conclusion that higher values are bound to prevail.

Opinion of Wood User

That this opinion is held by some of the trade is illustrated by the following extracts from a letter sent in by a large furniture manufacturer.

"In our opinion, several of the hardwoods, such as Oak and Gum, are now lower than a normal figure and we anticipate an advance sometime next Spring, as we do not believe that these woods can be produced at the figures at which they are being sold at the present time. We do not look for any material drop in the price of native lumbers, such as elm, basswood, birch, maple, etc. With regard to walnut, which is what we use more than any other high class wood, this has not dropped any in price as yet and we do not look for any reduction."

In Canada the same condition holds true, though to a lesser degree; with regard to such local hardwoods as birch, beech, maple, basswood, elm, etc. The demand has eased and slight price reductions have been made, but on the whole the hardwood situation in Canada is much better than south of the line. At the present time prices are firm and are not likely to go any lower. Available stocks are below normal and owing to the uncertainty and the lower values, production for the coming winter is not expected to total as high as last year. Expenses in the woods this season are high, wages being above those paid last year. If this is any criterion, higher manufacturing costs will prevail.

It is in the best interests of all, both lumber manufacturer and consumer that the market be stabilized. This can be done by steady, careful buying. Delayed buying last fall and during the early months of 1920 was largely responsible for the inflated values which

prevailed during the spring and summer. Are we about to see a repetition of similar conditions, on perhaps a smaller scale?

If there is any truth in the saying that "When everybody is selling is a good time to buy and when everybody is buying is the best time to sell." Now is the opportune time to buy.

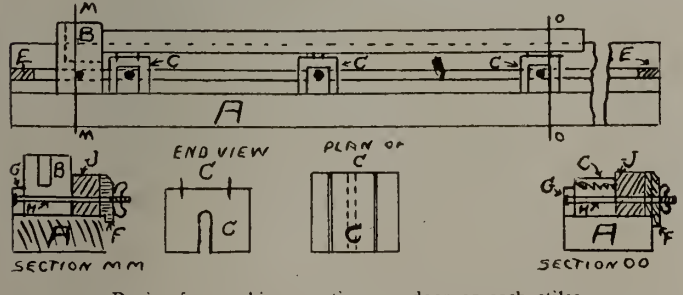
Handy Device for Marking Mortises

By Alf Paro.

The accompanying illustrations show a very handy device for laying off mortices in sash and door stiles and other similar pieces. It consists of primarily a bed piece A 1½ inch thick, 3½ inches wide and 8 feet long, on which is attached one or more adjustable stops B and a number of moveable blocks C, to which the markers are attached. The stop B has a large groove cut part-way through so as to accommodate any tenon, as thick as ½ inch, which might happen to be on the stiles or rails. This also makes provision for the marking of meeting rails and for tenoned pieces.

The marking blocks C are usually made from stock about 1⅛ x 1½ and cut to the required length. It is well to keep an extra length or two of this size stock on hand so that when an extra marker is needed it is only a matter of a few minutes to cut off a block and attach the pieces of old band saw blades which are used to mark the mortices. This is done by laying out the width of the mortice on the block, allowing 1 inch of solid wood on each side and sawing it with a ¼ inch hack saw. Care must be taken to make the cut square across the block. Next, take a short piece of band saw blade, say, 1 inch long and laying the block on a solid bench hammer this short length into the saw cut, teeth down. Be sure that both pieces are driven down level with each other. The next step is to take a flat file and bring them to a cutting edge.

A block of this kind will be required for every mortice to be made. By having sufficient bolts, the bed piece can be filled for the whole 8 feet. J is two strips ⅜ x ⅞, same length as the bed. The lower one is glued and nailed to the bed piece parallel with the back, keeping it in ¼ inch from the back edge. This is so that the shoulder on the wooden washer, F, will have a face to work against and thus be held in an upright position. Two small blocks E are nailed on top of the first strip and then the top piece is fastened in

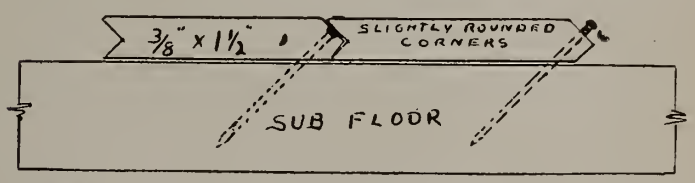


Device for marking mortices on door or sash stiles

place. Thus a groove is formed for the bolts to slide in. The washers F are made in strip length ¾ x 1½ rabbeted to provide a shoulder and cut into about 1½ inch lengths. It is probably better to bore the holes for the bolt before cutting into blocks. Washers, G, used on the front are made in the same way except that the rabbet is not required. Carriage bolts, say, 5/16 x 4½, with butterfly nuts, are used to hold the stop and marking blocks in place. The marking blocks are bored for the bolt and then cut through from the bottom. This aids in making changes as by simply loosening the nut, the block can be lifted off without removing the bolt. This will be found a very handy rig for sash and door factories.

Marketing Finished Oak Flooring

A new departure in the manufacture of hardwood flooring, one that embodies certain new and unusual features, is the finished oak flooring being placed on the market by the Crooks-Dettman Co., of Williamsport, Pa. This flooring is filled, finished and waxed before it leaves the factory, so that as soon as the laying is completed the floor is ready for use. Not only is the flooring finished, but it is, as far as possible, sealed against all moisture. To this end the edges, ends and back are given protective coats. Another feature of this flooring, which is made 36 in. thick and 1½ or 2in. face, is the joint used to replace the usual tongue and groove. The accompanying sketch gives an idea of the joint used. The holes for the nails are punched and where the nail is driven the head does not require to be "set" as the succeeding piece covers it. With this joint the strips do



Showing special design of joint with round corners for hardwood flooring

not have to be driven home to secure a tight joint, little or no pressure being required. The rounding of the face edges slightly, is a new departure in the manufacture of hardwood flooring. It is just possible that some would object to a joint of this kind. A flooring of this kind, which any practical man can lay in his home and which does not require to be finished, should find a ready market and result in an increased demand for flooring.

Slack Belts and Idlers

When walking through different plants one can hardly help noticing how tight many of the belts are being run and how often the "idler" is resorted to, in an effort to increase the tension. On a vertical drive this may be necessary, but there seems little or no excuse for tight belts and idlers on horizontal belts There are many objections to running tight belts among which might be mentioned excessive wear on bearings, excessive power consumption, short-lived belts and high up-keep costs. These may, in the majority of cases, be eliminated by treating the belt so that it will be soft and pliable and cling to the pulley. Then run the belt slack so as to increase the arc of contact. Of course the belt must be of sufficient width to transmit the load.

The idler is used to increase the arc of contact and also to increase the tension on the belt. While in some instances it will be found absolutely necessary, yet wherever possible it should be eliminated. If by treating the belt and running it slack the same amount of power can be transmitted, not only is the cost of the idler saved but the life of the belt and bearings is increased and a saving made in power consumed.

Don't blame others for dangerous conditions. Help to correct them.

Handling Reduced by Labor-Saving Installation

Box Factory Eliminates Factory Trucks—Conveyors and Gravity Carriers More Stock from Operation to Operation—Manufacturing Cost Reduced to Minimum

F. H. Strong

IN the manufacture of box shooks every mill faces serious competition, and in order to stay in the business and make profit the chief aim must be to combine large production with low cost of manufacture, and at the same time maintain a high standard of quality in the finished article. To this end many new machines, methods and ideas in regard to factory arrangement have been evolved. Some of the latest and most effective of these are incorporated in the new electrically-driven plant of the Cranston Box Mfg. Co., Spokane, Wash.

This modern specialized plant is so completely equipped with power conveyors that not a factory truck is used, and no man need take more than a step to transfer material at any point along the line of production. Mr. A. E. Cranston, who planned the factory, has taken advantage of every mechanical facility available to eliminate the necessity of trucking or carrying stock from one point to another. His plan of manufacture includes a straight line of production, the rough lumber entering at one end and the finished product, all bundled ready for shipment, leaving at the other end of the mill. This cuts out lost motion, lost time, extra labor and thereby turns a large per cent. of the usual box factory "non-productive" into efficient production. The plant is not a large one, but it represents what is conceded to be the latest thing in its line.

How Labor is Conserved.

The factory building is 60 x 100 ft. and is built right next to a railroad siding. Loads of lumber from the yard are tied in the middle, to form a compact "package," and rolled off special trucks onto an inclined roll-way leading into the mill. The part of this roll-way inside the factory is level, and packages of lumber are advanced forward to it by power drum and

Conveyor used to move stock. Note gravity carrier between resaws.

cable. The lumber is then untied and fed through a 6 x 15 inch American four-side planer, directly coupled to a 40 h.p. G. E. motor running 900 r.p.m. A self-feed rip saw is also located at this end of the factory, but it is seldom used except on special work. Lumber for the regular line—apple boxes—is both sized and surfaced on the planer. From here the stock shoots out onto a system of cross-conveyor chains and is carried to three cut-off sawyers, who work on an elevated platform as shown in the accompanying illustration.

As the boards pass along just below the cut-off saw tables the sawyers pick them up and cut them into box lengths. All cut stock and scrap falls into a conveyor trough and is sorted for size and grade. Practically everything that is good enough for box shooks is passed from the conveyor to the Yates No. 287 hopper-feed, horizontal band resaw. The 6/4 inch stock

Showing conveyor moving stock from planer to trim saws on raised platform.

intended for box ends is resawed once, and as it comes through the machine it is stacked on a conveyor belt which carries it to the end of the room where the machine binder is located.

Gravity Carrier Used.

Material for tops, bottoms and sides, after being resawed once on the horizontal band, is stacked on a gravity roller conveyor and sent to the vertical band resaw. This machine has 48-in. wheels, carries a 5-in. saw and is driven by a 30 h.p. G. E. motor running 680 r.p.m. Sawed material leaving the vertical resaw is piled onto the same belt conveyor that carries stock from the horizontal band to an automatic machine binder. At this writing a twin circular resaw is being installed to handle stock for tops and bottoms; the saw arbor will be directly connected to a 50 h.p. Fairbanks, Morse & Co. motor running 1800 r.p.m. A boxboard matcher is also being installed.

The tying or binding machine is an invention of Mr. Cranston and is known as the double-head Cranston automatic wire binder—called double-head because it will wire two different bundles, or both ends of one bundle, at the same time. Shooks are simply bunched and fed into the machine, which advances them forward, binds and ties them into a convenient bundle and discharges the bundles, by means of an extended conveyor attachment, into the shipping conveyor on the outside of the building. The last named conveyor carries the bundles directly to cars spotted along the railroad siding.

Material for cleats is sawed on a gang cleat saw

located near the wire binder. The cleats are tied with string into bundles of 100 each.

Getting Rid of Waste.

The conveyor serving the cut-off saws discharges its scrap into an elevating conveyor which deposits the wood in a large hopper partitioned off from the shavings bin. The shavings and wood bins, by the way, occupy only the upper half of the building in which the dust-collectors are mounted, The lower story of this building is completely fitted up as a filing, grinding and general repair room.

All matches in the plant are piped to a 60-in. exhaust fan which is belted to a 35 h.p. Fairbanks, Morse & Co. motor running 900 r.p.m. This refuse and the cuttings are sold locally for fuel. At present eight and nine carloads of apple box shooks are being shipped from the factory each week. The daily output with present equipment averages 35,000 to 40,000 ft. of box shooks.—"Woodworker," Indianapolis.

C.M.C. Appoint New Representative

W. J. Irving has been apointed manager in charge of the Toronto Office and warerooms of the Canada Machinery Corporation, Limited, Galt, Ont., succeeding David King, who is retiring. Mr. Irving has been in the employ of the C.M.C. since their organization, some ten years ago. Part of this time he carried Western Ontario and latterly in addition to his sales work he has had full charge of the C.M.C advertising. Mr.

W. J. Irving, Galt, Ont., in charge Toronto branch of C. M. C.

Irving is a practical man, was with the John Ballantyne Co. before joining the C.M.C. staff, and has been instrumental in designing and bringing out several new machines. One of these was the well-known C.M.C. No. 611 straight Edging and Jointing Saw. As intimated Mr. King, who is getting well up in years, is retiring from active work. He has been in charge of the Toronto office for the past 6 years. Previous to that he was with the McGregor, Gourlay Co. for 35 years.

Specializes in Woodworking Statistics

R. G. Lewis, Dominion Statistician of the Forestry Branch, Ottawa, occupies an important and yet somewhat unique position in connection with forest products tabulation in Canada. His duties as Forestry Statistician consist in co-operation with the Dominion Bureau of Statistics in the collection, compilation and publication of statistics relating to forest products. This work at present covers the production of lumber, lath, shingles, pulpwood, pulp and paper, planing mill products and some of the more important wood-using industries. The figures for these are collected annually and published in bulletin form.

Mr. Lewis is a graduate of the Faculty of Forestry of the Toronto University and for the past eight years

R. G. Lewis, Dominion Statistician, Ottawa, Ont.

has been acting as statistician for the Forestry Branch in Canada's capital city with the exception of two years, when he was on active service. Fifteen months of this time was spent in France as technical officer of the Canadian Forestry Corps.

Mr. Lewis states that, in connection with the wood-using industries, arrangements are now being completed for a renewal of the wood-using industries studies which were made by the Forestry Branch from 1911 to 1916. The work was interrupted by the war and it is gratifying to learn that it is likely to be resumed. During the five years that it was in progress, the Dominion was covered by a series of studies of the industries using wood as a raw material. It was intended to study each of the five regions—the Maritime provinces, the prairie provinces, Quebec, Ontario and British Columbia once every five years and to have each study explained by a published bulletin except in the case of British Columbia. It is understood that this investigation will be continued this year by a study of conditions in Ontario, undertaken in co-operation with the Bureau of Statistics.

Many men have lost their hands when they attempted to remove chips from moving machinery.

Box Men Hold Enthusiastic Gathering

Twenty-first Semi-Annual Meeting Successful Affair—Many Subjects of Interest Discussed—Advertising Campaign for Boxes Decided on—No Reason for Pessimism

THE twenty-first semi-annual meeting of the National Association of Box Manufacturers brought out a very enthusiastic gathering, comprising some seventy-five representative manufacturers. These gentlemen were unanimous in their opinion that, in spite of the present era of depression through which we are passing, the future would develop into a period of unprecedented prosperity.

The president, B. F. Masters, gave a very interesting and comprehensive review of the box industry, including its trials and tribulations. He counselled those assembled to give close attention to costs and market conditions and to avoid, if at all possible, attempting to increase sales by cutting prices. He also touched on the wage tendency and labor conditions in general and thought he could detect a new note in the attitude and sentiment of labor. The importance of production and accurate cost-finding were not overlooked. In discussing present trade conditions, he suggested that the manufacturers, in need of lumber, go into the market and buy. Stability of market conditions is a very desirable state of affairs, and a slight increase in the demand for lumber would have a tendency to stabilize the lumber industry. He also had a word to say with regard to competition. In his opinion the keenest kind of competition was to come from those in the box manufacturing industry rather than from manufacturers of substitute containers. He did not see any cause for pessimism, as all underlying business conditions are hopeful. The crop this year is a bumper one, and, with proper marketing conditions, the nation should experience a regeneration of business. In closing, he spoke appreciably of the secretary, W. D. Burr, and the able corps of assistants with which he has surrounded himself.

Mr. Masters' address was followed by the report of Secretary Burr. He gave an outline of the work of the Association for the preceding period and recorded the addition of twenty-seven new members to the roll. Mr. Burr touched on traffic matters, trade extension and the question of standardization. He is very enthusiastic regarding the work done by the Specification Committee, and the support and co-operation given by the Forest Products Laboratory at Madison, Wis. In speaking of the decreasing lumber production in the country, he said: "I am firmly convinced that we must develop the use of boxes which, without sacrificing security, may be made of less material. There are many reasons why this is true. The competition of other types of boxes, the higher freight rates, the increased cost of lumber and the decreased supply of raw material, but aside from these very good reasons, if you can produce a greater number of boxes from every one thousand feet of lumber, then you will enable your industry to hold its own and you will profit more as individuals." Mr. Burr's address was followed by reports from the assistant secretary of the different district associations.

A feature of the closing session was the presentation of the proposed Direct Advertising Campaign by Col. H. P. Howard. Mr. Howard discussed the various samples of direct advertising, which had been prepared for the use of the members. These include attractive mail stuffers, blotters, and various forms of circulars and booklets. The plan as outlined, is to confine the work largely to direct advertising, that is, making a direct appeal, by mail, to those who use, and are interested in, boxes. In detail he said: "We want to tell them that wood boxes are the strongest, most serviceable, the best-looking and most economical in the long run; that they will stand hard knocks; cannot be hurt by hooks; protect goods from rough handling by weather, heat and cold; that when reinforced by wire and steel, they will carry merchandise around the world and then be good for another trip. We want to tell the shipper that we will design and make for him a box for his special purpose, for his special product, and save him money in shipping losses and pilferage. We want to tell him that our boxes deliver the goods in good condition and please customers. There are many things we want to tell him and each one of these things is an idea."
was given the whole-hearted endorsation of

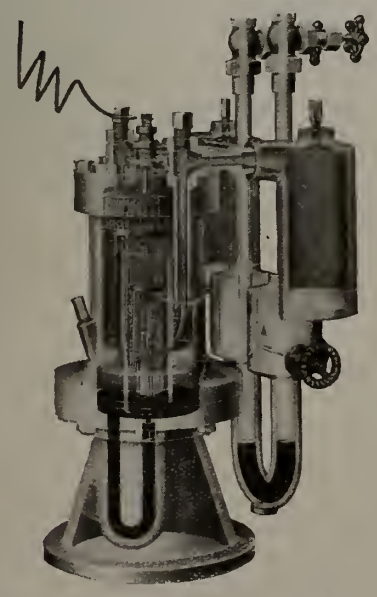
General publicity material, that is material which advertises the whole industry, will be distributed free by the association to its members. Circulars, blotters, booklets, etc., advertising a special plant will be supplied at the cost of the printing and paper. Thus the members are able to secure the necessary material through the publicity department of the association cheaper than if purchased individually from different printers. It is anticipated the information which may be presented in this way, will have a very beneficial effect on the demand for boxes.

The publicity scheme was well received and was given the whole-hearted endorsation of those in attendance; in fact, practically all present promised to make use of these advertising helps.

Machinery & Equipment

Meter for Checking Steam Consumption

The instrument shown in the accompanying illustration is what is known as the Republic Flow Meter and is used to determine the flow of steam and through the process of elimination, enabling the efficiency of the engine, pump, kiln, or any steam-using unit in any department to be accurately checked up. In actual practice it has been found that many units use considerable quantities of steam in excess of their rated requirements due perhaps, to worn parts, faulty installation or carelessness. By checkng up and rectifying such faults many pounds of steam are saved effecting economies that result in reduced operating costs and the saving of thousands annually. This measurement is accomplished by means of an electric current, which is regulated by the differential pressure of the flow. The current measured electrically represents directly the amount of fluid passing through the pipe to which the instrument is attached. Maximum accuracy is insured by the highly sensitive electrical instruments which are governed by the well-known relation between velocity of fluids and equivalent pressure. Bl employing electric current to transmit the action to the reading instruments, all uncertain mechanical appliances, such as floats, cams, levers, gears and stuffing boxes, are avoided. There are no moving parts in the meter body to interfere with the true level of the mercury column. Due to the electrical principle of operation, the instruments for indicating, integrating and recording the flow may be arranged to conform with every variation of plant conditions. They can either be separated, combined, or duplicated; and can be placed at any desired distance from the measured line and at any point however remote from the meter body. Full particulars may be secured from The Republic Flow Meter Co. of Canada, Limited, Toronto.



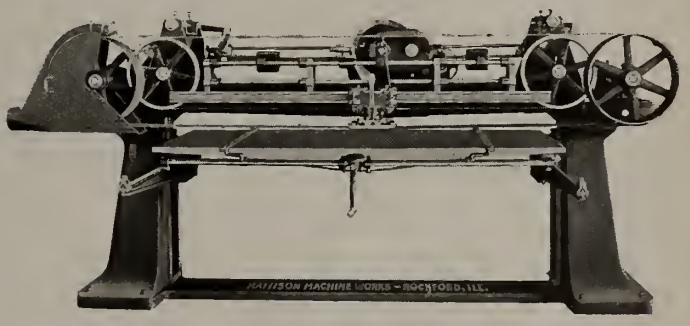
The Republic flow meter for checking steam consumption

New Automatic Power Stroke Belt Sander

The Belt Sander illustrated is a brand new power stroke belt sander, and is said to represent the first real advancement made in this type of machine during the past ten or fifteen years. It is the products of the Mattison Machine Works, Rockford, Illinois, U. S.A.

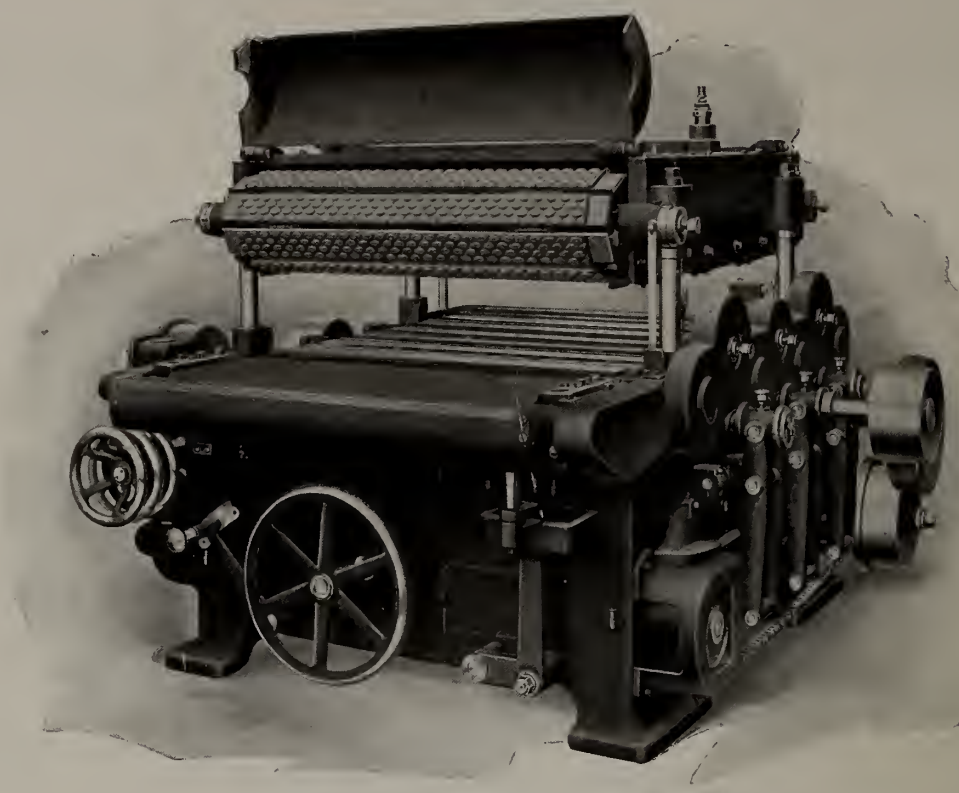
The power stroke can be instantly disengaged, leaving the sanding shoe free to be operated by hand for spot sanding. This feature is an important one, as it really combines two sanding machines in one.

Another important improvement is that the length of stroke and the number of strokes per minute can be instantly and simultaneously controlled by the operator without moving from his working position. He is thus enabled to adjust length and speed of the strokes to conform to the length or shape of work being sanded.



New Mattison belt sander with automatic power stroke

The reciprocating stroke mechanism is provided with double end drive and take-up. This does away with all lost motion. It also permits of a higher speed a much smoother reverse motion. It also permits of a higher speed, which is quite desirable. Among other mechanical refinements is the tempered steel band in place of the old-fashioned twisted wire cable. Chrome Nickel hardened steel gears, segments, etc., are used in the reciprocating mechanism. The sliding shoe is made practically frictionless by use of ball bearings. The track frame, which supports the sliding shoe, is also hinged on ball bearings. It is principally made of aluminum for lightness; and being accurately counterbalanced, gives an extremely sensitive pressure control, which is very essential for perfect sanding. The machine throughout is rigidly built to withstand the shock and strain peculiar to this type of machine. Further particulars on application to makers.



American combination roll feed and endless bed sander

Combination Endless Bed and Roll Feed Sander

As the name given to the machine implies it is a sander having the advantages of both the roll feed and endless bed types. The endless bed feed works are placed above and are adjusted up and down to accommodate stock of various thicknesses. This form of construction results in less wear on the metal slats to which the rubber pads are attached as well as on the pads themselves. This is due to the fact that the pressure of the slats against the guide is the pressure of the stock less the weight of the slats. Again placing the endless feed works above enables the bed to be made stationary and at a fixed height from the floor, permitting receiving and delivery tables to be employed. In addition to the regular feeding mechanism, this machine has an auxiliary infeed, rubber-faced endless bed which carries the work with the sander. The top frame is supported on four corner posts, and rises and falls on raising screws. All backlash has been avoided. The cylinders are three in number, each made in one piece, of semi-steel casting, turned, ground and balanced on especially constructed machines. They are provided with a patent automatic paper tightener, which takes up all slack in the paper while the machine is doing its work. The adjustment of the cylinders is regulated by hand wheels, placed together on the working side of the machine in convenient reach of the operator. The raising and lowering is accomplished by wedges. Three speeds for feed are provided, for different work.

Power hoist is provided for the top feed works, made in one width only 43 inches. Full particulars will gladly be furnished by the makers, the American Woodworking Machinery Co., Rochester, N. Y., or by their Canadian representatives, the Garlock-Walker Machinery Co., Limited, Toronto, Ont.

Simonds Establishes British Saw Company

The Simonds Canada Saw Company, Limited, "The Saw Makers" of Montreal, Quebec, have just secured a charter and established a new company in Great Britain, to be known as Simonds Saws, Limited. An office and shop has been opened at 53 Bayham, Camdentown, London, N. W., where a full line of Simonds Saw Steel Products as is demanded in Great Britain will be carried. The shop will provide for maintenance and repairs of saws, machine knives, and other edge tools produced by the Simonds Company.

Guy A. Eaves, formerly connected with the Fitchburg, Mass., plant of the company, has assumed the duties as office manager, and Leon E. Wilbur, a Simonds man, who has covered the Great Britain territory since his discharge from the army in France, will be associated with him.

The Simonds Manufacturing Company now maintains plants in Fitchburg, Mass., Chicago, Ill., Montreal, Canada, and a steel mill at Lockport, N.Y., where the steel is used in the manufacture of Simonds Saw Steel Products. In addition to the new British branch the company maintains twelve branch houses, located throughout the United States and Canada.

"The three great fundamental reasons for the safety movement in industrial plants are economic, humanitarian and efficiency," stated R. M. Little, director of the Safety Institute of New York city, in his address on "Industrial Safety" at the luncheon of a Canadian Manufacturers' Association recently.

Mr. Little pointed out how the American firms had been converted to the movement to such an extent that five thousand companies were now members of the National Safety Council. In Ontario five hundred companies are members of the Ontario Safety League.

Upholstering and Trimming

Uniform Cost in Upholstering

Tends for Greater Efficiency and Elimination of Unfair Competition—Variations in Costs Found

By W. E. Widdikim.

AN effort is being made both in Canada and United States to establish some uniform method of figuring labor costs in the different factories devoted to the manufacture of upholstered furniture. That the adoption of a uniform or basic method of figuring costs by the members of any industry is a desirable condition, almost anyone will admit and the investigations already made in the upholstering field have shown the absolute necessity of some such move being adopted by the upholstering fraternity.

In the United States the Industrial Relations Department of the National Association of Upholstered Furniture Manufacturers, which was established early in the year, have been making a series of time studies in upholstering plants, in relation to labor costs. In this connection they have recently issued a few suggestions to their members covering the cost figures on certain leading and practically staple lines. The ideas outlined were not intended to be rigidly followed by the members but were more along the line tentative suggestion of what might be considered ideal methods and along which it would be desirable to work in order to secure the greatest efficiency.

An attractive upholstered chair by Woeller, Bolduc Co., Ltd., Waterloo, Ontario.

Canadian Manufacturers Co-operating

The Canadian furniture men through the Furniture Manufacturers' Assocation are exchanging information with the American association with a view to bringing about more uniform costing methods in the upholstering branch of the Canadian furniture industry and, perhaps, the general adoption of some simple, basic cost finding method. With this in view the cost accounting section of the Furniture Manufacturers' Association is making a close analysis of the costs in the different upholstering plants. It is expected that much interesting and even startling information will be brought to light. In any event, it is absolutely necessary that correct costing methods should be established in all upholstering factories.

The analysis which is being conducted by our friends to the south has shown a great variation for the labor costs on practically the same articles in different factories. In many instances this discrepancy has been as high as one hundred per cent. and more than that figure in a few plants. Labor conditions, higher wages or different methods of working might account for this variation in certain instances but that would not hold true in every case. In many plants economies can and will be effected which would tend to equalize conditions. Owing to the diversity of the lines produced many articles could be compared; but if comparative figures were available no doubt the same discrepancies would be found to exist.

Form Basis of Comparison

One of the most beneficial results accruing to any industry through uniformity in costing methods, is, that such figures may be used as a unit or basis of comparison by which any manufacturer may compare the results he is securing in his plant with those of any other organization making a similar line. This would naturally tend for greater efficiency as one man would feel that he could manufacture as cheaply as his friendly competitor or would want to know the reason why. He would immediately begin to analyse his manufacturing methods so as to ascertan his weak places and see where economies may be gained and greater efficiency secured. This would be beneficial to any industry as well as to any individual organization.

As it is now if two men are making a similar article and one disposes of his product for considerably less than the other. The latter does not give his rival credit for being any smarter or for conducting his business any more efficiently, but takes it for granted that his own cost figures are correct and that his competitor does not figure correctly and is selling below the cost of production. On the other hand, he might feel that he can manufacture as cheaply as anybody and regardless of what his cost figures show, cut his prices to meet all competition. Such a course leads to mutual distrust and cut-throat competition.

In the cost analysis which is being made each minute operation is studied, timed and averaged. Thus in comparing the figure secured, a person is able to see where he is weak as well as where his methods are up to standard. As it is only natural for a manufacturer to strive to improve the weak places in his manufacturing methods the whole industry thus standardized is raised to new high levels of efficiency and everybody benefits.

Nearly as colorless as water

Compare a test tube of La Tuque Turpentine with pure water. They look very much alike, for the turpentine is nearly as colorless as water.

Dip a piece of pure white paper into our new Canadian Wood Turpentine

THIS is an easy, practical test of this new turpentine, made from Canadian Wood, by a patented process.

After dipping the paper to about one-half its length, place in a warm spot to dry. In a few minutes when the turpentine will have evaporated completely, compare the portion dipped with the remainder of the sheet. It will be clean and unstained, with no trace of grease of any kind.

As a thinner for wood fillers and enamels, and oil and japan colors, it is very satisfactory. It is also giving good results in some types of oil-stains, due to its smooth, even evaporation and great penetrating power.

And because it is an all-Canadian product, made from wood cut in the forests of Quebec, it naturally possesses a price advantage. May we tell you about it? Liberal samples are gladly sent upon request.

How to Reduce Finishing Costs

Labor Saving Equipment Factor in Modern Finishing Room—Drying Varnish in Eight Hours—How One Firm Facilitated Handling

By A. M. Wark.

Were it possible for an old time finisher to visit a modern finishing room he would be astounded at the efficiency shown and the many changes that have taken place, even in the last few years. Not only are new methods and new equipment in vogue but new stains, varnishes and finishing materials are being employed, so that today the finishing department is on a production basis that enables it to keep up with the increased output of the plant. It is proposed , in this article to describe the labor-saving, production equipment as found in some of the more up-to-date factories.

One read in the "Canadian Woodworker" of January, 1920, of a furniture factory that turned out seventy-five completed bedrooms suites every eight working hours and who claimed that in twelve and one half days from the time the dry lumber entered the plant it was on the shipping platform finished, crated and awaiting shipment. This gives a slight indication of what modern production methods have done for furniture makng.

Higher Production Necessary

Picture the old-time finishing room if forced to keep up to a schedule like that; can you see the immense finishing department that would be required and the large staff of workmen necessary to handle such a large number of pieces. Even though the space required were available and the necessary finishers could be secured, it is doubtful if such a schedule could be maintained for under old conditions it required practically twelve days to finish an article with a three coat varnish finish, provided sufficient drying time were allowed for each application of varnish to harden thoroughly. Thus apart from the economies and savings that may be effected through the use of modern labor-saving, finishing-room equipment, such installations are demanded by latter-day efficiency methods and by the fact that through the use of new, high-production woodworking machines the output of the other departments have increased to such an extent that the finishing department was not able to cope with the work coming through.

This increased efficiency has been secured in three ways; first, by improving the method by which the materials were applied, second, by reducing the drying periods and third, but substituting automobile rubbing mechanics for the slower hand rubbing. The methods of application have been developed along two lines, namely, by spraying and by dipping. While the up-to-date finishing room is equipped with dipping tanks for applying certain stains and even varnishing certain articles the greatest advancement has been made in the development and installation of spray finishing equipment. With the spraying machine one man can put through as many articles as could be finished by from five to ten men brushing on the material. It will be seen from this that the introduction of spraying equipment has not only enabled the finishing room to keep abreast of the other departments but has resulted in reducing the cost of applying the different materials; for this equipment has been used successfully for applying not only varnish, but stain, shellac and filler.

Dipping Methods Improved

This method may be a little more wasteful of material, though this compensated for, to a certain extent, by the fact that a thinner, more even coat is applied and is more than offset by the saving in time which is effected. Even though spraying equipment did not result in reduced finishing costs installations would still be required to increase production in this department, and keep it on the same basis as the rest of the plant.

Certain improvements have been made in the dipping process, through the introduction of mechanical equipment which lowers large racks of articles into a tank of varnish and raises them out again very slowly, taking probably half an hour or longer to lift a piece clear of the varnish. I hope to be permitted to describe this equipment in another article in a later issue. The secret lies in the fact that raising the pieces so slowly enables the varnish to flow off slowly and evenly doing away with all runs and giving a fine smooth finish.

Varnish Drying Kilns

The reduction in the drying period is secured by automatic humidity controlled varnish drying kilns. These are found in the many more up-to-date plants though the practicability and advantage of drying a coat of varnish artificially in from eight to ten hours does not seem to be fully recognized. Such a method enables the work to be put through like clockwork resulting in an even steady production. It works out something like this: first, coat of varnish, then overnight in kiln, second coat and over night in kiln, third coat and into the kiln and then into the curing room for a few days and into the rubbing department. Each coat is dried evenly and thoroughly and from the bottom out. If the pieces were allowed to stay in the kilns for twenty-four or forty-eight hours the varnish would not be in any better condition.

This quick drying is secured through the application of warmth and humidity. Just putting the pieces in a room and raising the temperature would in all probability retard the drying rather than hurry it, due to the fact that warm dry air would cause a skin to form on the surface, sealing it and preventing the oxygen from reaching the body of the coat. Admitting a certain amount of moisture with the warm air tends to retard the surface drying and even assists in hardening

the varnish for it has been found that a limited amount of humidity in the air is very beneficial to the drying of varnish.

Three Essential Factors

The modern varnish drying kiln is one in which both the temperature and the humidity is controlled automatically so that constant drying conditions are maintained at all times, a very desirable thing in itself. In this connection an adequate ventilation must not be overlooked for if the air is not changed and renewed the supply of oxygen would become exhausted and the air would become saturated with the fumes of the drying. In this respect the process is similar to the successful drying of lumber for in both cases warmth, moisture and circulation are prime requisites.

Increased producton in the rubbing department has been secured through the adoption of rubbing machines either of the stroke, electric or pneumatic types. The stroke rubber is a large production machine particularly suitable for the rubbing of large surfaces. One phonograph factory in which the writer worked had one of the machines fitted up for rubbing the ends and back of the cabinets. They had attached two sets of felts to the moving mechanism and by placing two cabinets end to end were able to finish two at a time. The electric and pneumatic types are light portable machines and are very versatile having a wide variety of uses and being suitable for either large or small surfaces. With the aid of a good rubbing machine a man is enabled to do many times the quantity of work that he could turn out by hand and as the first cost is about the only cost the advantages of an automatic rubber and the savings that can be effected through its use are too apparent to require reiteration.

The accompanying illustration shows the method of handling, adopted by a large manufacturer of pianos in an effort to reduce handling costs and facilitate the movement of work through his finishing room.

There are many formulae for floor crack fillers, and also several different kinds of cracks that require the filler. Then select the filler best adapted to the crack. One master painter tells us that he takes some cheap varnish, or odds and ends, and gradually stirs it into plaster of paris to make a stiff putty. This is for large or wide cracks. For smaller ones the putty may be made thinner. Do not use japan or turpentine in this mixture.

How the Appollo Piano Co., DeKalb, Ill., facilitated the movement of stock through their finishing room and reduced handling costs by an efficient overhead installation

Overcoming Cold Weather Finishing Troubles

Problems Peculiar to Cold Season—How Low Temperatures Effect Different Materials—Some of These Permanently Injured—Suggestion For Eliminating Undesirable Features

By H. Sutton

NOW that the cold weather is imminent, it might be well to touch on a few of the troubles common to this season of the year. All finishing material is affected more or less, some of it permanently, by low temperatures, both when in storage and after being applied. This is particularly true of enamels and varnishes.

Cold will cause the oils in these two materials to congeal, thereby making the liquid sluggish and heavy to work. The "chilling," as it is called, is the cause of many bad after effects. If such material has been exposed to the cold, it will, when applied, show specky and lumpy. Again, cloudy effects will ofen be the result, especially with varnish. The specks are due to a physical change in the material caused by the cold, and while resembling undissolved particles, they are due entirely to the congealing of the oil content. This effect is not due to any inherent fault in the material itself or the ingredients used but is simply the result of exposure to low temperatures.

Permanent Changes Effected.

One should hesitate a long while before applying a varnish or enamel. When it is in this condition, should it become necessary to use it, it can readily be remedied by placing the material in some warm place such as near a steam pipe or stove. Care should be taken, however, to see that it is not exposed to an open flame. Placing the can containing such material in boiling water is, probably, the best method of warming it as there is no danger either from flame or from overheating. When once restored to its usual condition, it may be applied without any misgivings, for the results of being chilled are only temporary and not permanent.

When it comes to water stains greater care must be exercised, for when they freeze, unlike varnish and enamel, such stains cannot be restored to their former condition. This is due to the fact that freezing causes certain changes in the aniline dies from which the color is derived, which are permanent. The complex nature of some of these dies in solution breaks down entirely when subjected to cold, and the stains are permanently spoiled.

On the other hand, oil stains made upon a benzol base solvent will freeze at about the same temperature, as water stains are not permanently affected by such exposure. Warming such material will bring it back to its normal condition.

Drying Offers Peculiar Problems

So much for finishing material. The drying of these same items are affected by cold and changing conditions. The spring and fall are two seasons which apparently bring more than their share of troubles. This is due to the fact that finishing materials must have an even temperature during the time they are hardening and setting. As a rule the heat is not kept on continuously during the two seasons mentioned, with the result that freshly-applied finish is often chilled for it has had time to harden with disastrous effects. Open windows in the finishing room, especially on cool days, will cause similar troubles. In addition, draughts have a tendency to make the finish crawl and wrinkle if they strike directly on newly-finished surface. The drying is also retardeed by low temperature and draughts.

Sometimes circumstances will arise which make the use of cold or chilled material absolutely unavoidable, there being no means at hand for warming it up. When this holds true, extra care should be taken in rushing it out. The natural tendency lies in the opposite direction, for the average finisher will flow a thick, heavy, working varnish on heavily in an effort to avoid brush marks. The opposite holds true when applying on thin, warm material where the high viscosity is due to the fact that the material is warmer than the temperature of the room. Such a varnish or enamel should be flowed on freely for the lower temperature of the finishing room and the surface on which it is applied will cause it to body up. If this material had been worked out, the surface would, probably, show brush marks, crawling and pitting, because there would not be sufficient body to take care of the shrinkage.

The same thing often occurs when articles have been brought in from a cold storage room or other cool place. If such articles are varnished or enamelled before they have had an opportunity to warm up, the material will be chilled immediately upon application, retarding the drying and resulting in cracks at a later period. This is particularly true if it is the middle cost that is being applied.

All Departments Should Be Kept Warm.

Another suggestion is that during the cold weather the temperature of the storage and warerooms should be maintained at least 60 degrees. Failure to follow this suggestion often results in cracks, showing up on the finished surfaces. This will be particularly noticeable on polished articles, for as a rule the finish on such pieces is short in oils and therefore has not sufficient elasticity to expand in shrinkage.

From the foregoing it would be gathered that it is advisable to see that the finishing material is stored in warm quarters, that the finishing room is maintained at a fairly high and even temperature, that draughts must be scrupulously avoided, that the articles should be given sufficient time to warm up before being finished and that all finished articles should be stored in warm, dry storerooms.

Two New Fibre Products

Two new products of interest to furniture manufacturers and upholsterers have recently been placed on the market by The Fibro Manufacturing Co., Philadelphia, Pa., in the shape of woven material designed primarily to facilitate the manufacture of reed and wicker furniture. These are known as Fibro-Tex Wibbing and woven Hard Fibre and are put up in rolls, running from 36 inches to 100 inches in width. In addition to furniture these materials may be used for such work as chair and car seats, baby carriages, baskets and similar products.

Spray equipment cuts down painting costs.

Improved Method of Painting Factory Interiors

The Spraying System Has Modernized the Painting of the Interior and Exterior of Your Factory as Successfully as it Did the Finishing of Your Product

By W. H. Welman

WHERE is the manufacturer in the furniture industry who does not, deep down, realize the full importance of having his factory walls and ceilings properly painted? It is recognized that dark, dismal and cheerless factory surroundings are about as practical as blind workmen, and must tend to blind good workmen if they remain on the job. Removing the shadow zones from the factory interior and giving it a light, sanitary and cheery appearance results in many big and well known advantages both to the employer and to the employee.

The rub in many cases has been that the cost of painting was prohibitive, or that there would be too great an interruption of production, or that men to do the painting could not be had. In other cases, painting has been done but not at frequent enough intervals, and much of the effect is lost. All of these barriers to the proper painting of factory interiors have been removed through the introduction of the spray system of applying any kind of paint on all knds of structural surfaces.

Adapted to Interior or Exterior Work

This modern, improved and economical system of painting should require no elaborate introduction to those progressive men making up the furniture industry, as a large percentage of the furniture manufacturers of this country are today profiting through the use of the spray system in their finishing rooms. In the same degree that the highest quality of varnishing or enameling is being done there at a remarkable saving in time and labor, equally remarkable economies and advantages are now to be had in the spray-painting of their buildings.

Economical and Efficient

This equipment is known as the Aeron System portable painting equipment, and is manufactured by The DeVilbiss Mfg. Co., of Toledo, Ohio, U.S.A. It is a development making possible the more effective and efficient application of paints that would be expected naturally to follow the remarkable success of the spray system in all of its uses in the industrial finshing room. Oil paints, mill whites, flat wall paints and other like materials are sprayed to equal advantage. Moreover, this method of application greatly increases the covering, light-reflecting and wearing qualities of these materials, completely eliminating skimped places, laps and brush marks. There is no dripping or spattering of the paint when applied, which offers a saving of material and which further insures cleaner work and surroundings.

At least three to five times more surface can be spray-coated than can be hand-brushed in the same time. There is no loss of time in dipping into and refilling the pail, nor through the painting of out-of-way places which are easily reached with the spray. Less staging or scaffolding as a rule is required on the average class of work, which affords another saving

in time and which causes less interruption to factory work.

The principal items comprising this equipment are a portable compressing outfit consisting of air compressor either gas engine or electric motor driven, and air receiver with safety valve and pressure gauge; a portable paint tank in a 7 or 13 gallon capacity with complete regulating device; an Aeron of the standard separate container type, or a special extension Aeron, 3, 6, or 9 feet long, for coating ceilings and walls without the use of scaffolding; and air and fluid hose in sufficient lengths for all requirements.

Worked From Ordinary Air Supply

When an air supply of sufficient capacity can be had in all parts of the factory buildings, the portable compressing outfit is not necessary. However, where building exterior painting is to be done, or work in parts of the plant where air is not to be had, it is essential to have this outfit. It is compactly mounted on a truck that can be easily rolled from place to place in or out of the building.

It has been demonstrated on practically every class of inside or outside factory painting that the equipment is thoroughly dependable in operation, and calls for very little upkeep expense. It has been further demonstrated that the savings effected through the use of this equipment will entirely off-set its first cost within a short time. More about the improvement and economy in the painting of factory walls and ceilings can be learned from a careful study of the illustrative and descriptive material interestingly presented in a catalog recently issued by the DeVilbiss company.

Let Spray Equipment Solve Your Trouble

Solution of Labor Question in Many Finishing Departments—Destined to Become Universal Method—Has Helped Reduce Manufacturing Costs as Well as Increase Output

By Howard G. Bartling*

When manufacturers, commissioners or representatives of other countries visit factories on this continent, they invariably marvel at the labor saving machinery being utilized. There is such an extensive effort being made in our factories to produce articles in great quantities with the least possible loss of time. that visitors wonder at the evidences of ingenuity which they behold. Many of them attribute this remarkable condition to the fact that the people in America are "money mad" and that the tremendous productions are caused by a desire to attain great wealth. The real facts concerning the earnest desire of these factories to increase their production and decrease their costs is simply to meet an existing condition fostered upon them by an avaricious and grasping labor element.

The manufacturers of this Western hemisphere invariably find that an increased demand for a product brings a corresponding demand from certain labor interests for an increased wage. The peculiarity of this arrogant and dictorial attitude is the fact that it is assumed only when every bit of available human energy employed in those factories must be used for handling the increased business. To cope with this situation it has been found imperative for every available inventive genius, scientific mind, and efficiency expert to devise instruments and machinery which may be utilized in keeping down the costs and at the same time increasing the production.

Special Equipment the Solution

The greaest contributing factor to the success of the furniture and allied wood using industries has been the air brush method of applying finishes, and the automatic rubbing machines to prepare surfaces. These wonderful inventions, have on numerous occasions, become life savers to factories employing men.. This is true in Canada as well as in the United States for the Canadian industry is rapidly awakening to the fact that the air brush is a tremendous factor in the quality of work obtained through its use and in the intense production of the various factories employing it.

*Sales manager, Paasche Air Brush Co., Chicago., Ill.

Recently a prominent furniture manufacturer was asked if he believed the air brush would survive. He replied that not only would it survive, but it would eventually become the universal method used for the application of all liquid finishes. In the United States ninety per cent. of the piano production is finished by the air brush method. The same thing may also be said of our automobile production, and the general furniture industry also owes its success and growth to the great production made possible only through the medium of their brush and its accessories.

Not an Experiment

All industries who have been keenly alert for efficiency in their production departments, and wide-awake to the superior advantages of possessing any device or tool which would speed up their work. Long ago realized the superiority of the air brush method and were quick to adopt it. Pianos, phonograph cabinets, desks, chairs, dining, parlor and bedroom furniture, artificial flowers, mechanical instruments, machinery, steel furniture, art glass, chandeliers and lighting fixtures, paper novelties, lamps, toys, picture frames, mirrors, dolls, works of art, waterproof cloth, wall paper, bookbindings, automobile bodies and chasis, wagon and truck wheels, tubs, buckets, and thousand of other industrial products are being most successfully finished by the air brush method.

Within the next few years, history will show that the experiment of air brush users has been exactly the same as the users of all other labor saving devices. They have all succeeded. Not only have they been boons to the producer and the consumer, but their energy saving features and less laborous operations, are enjoyed by persons who use them. Therefore, the air brush will become more popular as its virtues become better known.

Make the Work Easier

One of the greatest objections against the air brush method which has been advanced by labor, is the fact that it will reduce man power. This is identically the same argument which was advanced against the introduction of the linotype machine in the newspaper offi-

ces some years back. The history of the air brush will be a repetition of the linotype machine's history. The hand painter who has been reluctant at first to recognize the faster and better method will gradually find he is chief beneficiary, under the air brush method, as it relieves him of that old back-breaking, muscle-aching work. It not only will relieve him of its drudgery, but will also bring him more work and greater remuneration for his services at less physical exertion.

The telephone, telegraph, automobile, electric light, steam engine, ocean liners, etc., are all labor saving devices so essential to our world of progress, yet none of them collectively nor individually has curtailed the use of labor. To the contrary, they have all been a direct cause of more men and women being employed in every way. The universal adoption of the air brush method simply means the overcoming of a hide-bound prejudice existing in the minds of practically all old school painters. The problem is an educational one and every air brush is sold is a form of sowing educational seed in the use of that device, because one sale invariably means another.

Obnoxious Fumes Eliminated

Fumes and odors which result from the atomization of liquids at high pressure are removed and entirely eliminated with the proper finishing cabinet, equipped with adequate and powerful exhaust system. This means greater comfort for the operator as well as reducing th fine risk.

When it is considered that the air brush can apply stains, fillers, shellacs, enamels, and varnishes of every description, more economically at less labor, and perform smooth and better work, it should be given careful consideration by every user of liquid finishing materials in Canada.

Now is Time to Paint Buildings

Suggestions for Mixing and Applying Paint for Outside Work—Shellac Knots and Sappy Spots

D. L. W.

The suggestions contained in this article are applicable not only to the factory and surrounding buildings but to the home, garage and other structures. Painting saves repair bills by reducing their size, besides adding to the appearance, and incidentally the value, of the property. This work should be carried out before the cold weather sets in, as painting should not be done when the temperature is below 50 deg. F.

The season when a temperature of above 50 deg. F. can be looked for at any time of day is drawing to a close, and there is a lot of work in the painting line yet to be done if buildings in many parts of the country are to receive adequate protection from the storms of the coming winter. For those who intend to save the cost of employing a qualified tradesman in applying paint to their buildings the following information will prove useful.

Value of Good Priming Coat.

Outside painting should be done in dry weather. Surfaces should not be painted while wet. Surfaces to be painted should be as smooth and clean as possible. They should be free from grease. In painting new wood, knots and sappy surfaces should be shellaced first. If painting over previously painted surfaces, all blisters and loose or peeled spots should be scraped or burned clean. A brushing with a stiff wire brush, followed by sandpaper, is good practice.

A priming coat usually pays for its cost. A firm base for the final coat is very essential to insure long service. The primer should be thin enough to penetrate the lumber; it should be well brushed in. Only pure linseed oil or pure turpentine should be used to thin paint.

Although frequently used, ochre is not a good primer. The primer should be of as good quality as the body costs, but reduced to the right consistency. Elbow grease is a very good thing to use on paint, especially the priming coat. If the paint is cracked in small hair lines which do not go through to the wood, reduce the first priming coat with equal parts of raw linseed oil and turpentine, in order to penetrate clear through to the wood. This only applies where the old paint is well bound to the surface.

If the old paint does not adhere well, scrape the surface with a stiff wire brush to remove all scale, then dust off with a stiff brush. Spots from which much of the old paint is scraped should be touched up with a thin coat of paint, reduced with turpentine. After this has dried, the surface is then ready for the first coat.

Peeling and Blistering.

Paint may peel from any one of several causes, but the most frequent cause is the improper application over a damp or frosty surface. Paint that is peeling rolls back from the surface in thin scales. A coat of paint put over a seemingly good surface will sometimes peel down to the bare wood or to the priming coat, showing that the old paint has lost its grip. Be on the lookout for this condition when repainting surfaces. The old paint surface should be well wire-brushed and dusted, after which the bare spots should be touched up with a thin coat of paint, reduced with pure turpentine. When these spots are dry, paint over with the first coat.

Blistering is easily recognized and is caused by moisture having come out of the surface under the paint or from priming to cheap ochre. When this condition exists, wire-brush and dust the surface, then wash with turpentine to cut any grease or excess oil which may be present. After this is dry, proceed as directed for first-coat work.

When the paint cracks into large blocks of every conceivable shape (becoming alligatoried, so-called), it is caused by the application of heavy non-drying undercoats, "fat" paint, the use of adulterated oils or from painting over cheap ochre priming. Boiled linseed oil in the undercoat will also produce this condition. The only treatment is to burn and scrape off the paint down to the bare wood.

Turpentine will readily penetrate through the staves of an ordinary wooden barrel. It is therefore necessary to coat the inner surface of the barrel with ordinary glue, which is insoluble in turpentine, but readily soluble in water, say naval stores experts of the Bureau of Chemistry, United States Department of Agriculture. Turpentine soon leaks out from a barrel that has been carelessly or improperly glued, as well as from one containing any water, regardless of how well the glue was prepared or applied. Consequently great care must be taken in preparing the glue and applying it to the barrel, and finally also in so filling the barrel with turpentine that no water gets into it. Detailed directions for glueing turpentine barrels were issued recently by the department.

MACO

New Principle Non-Fading Stain

¶ Under ultra violet ray test it endured the equivalent of thirty days in bright sunshine without the slightest tendency to fade.

¶ It penetrates without raising the grain of the wood.

¶ It can be filled directly over like a spirit stain.

¶ Has the advantages of an oil, a spirit and a water stain with none of their disadvantages.

¶ Write for sample panel and full particulars.

IMAGINE sifting through delicate silk mesh anything with edges sharp as broken glass. Wonderful? Hard to believe? The crystals of Speed-grits when glued to paper or cloth will cut, grind or polish the hardest steel. Yet, so light are they, that they don't harm the tender elastic silk sieve of the Speed-grits grading machine.

The wizardry of it—

Up from the dust of the crushing room glide the bucket-elevators—each bucket heaped high with its load of crushed and sharp-splintered abrasives.

These tiny grits, so near alike that with the naked eye you can't tell one from the other, must not vary in size. One grit a trifle oversize on abrasive paper or cloth is enough to mar and scratch a fine polished surface. That's where the need of exact sorting comes in—and the grading machines are wizards at it.

Watch that machine as it starts work — watch its screens of fragile silk fibres as they begin vibrating gently—watch how the screens sort out just the grits they want from the stream of mixed sizes that flows over their silken surfaces. Results are nearly always 100%, but one oversize grit may have squeezed through.

No chances are taken with Speed-grits. Straightway these sorted grits are turned over to two expert screens —post graduates of the school of accuracy. Number One of these experts sifts out the grits that are too small. Number Two sorts out the exact sized grains wanted. Every oversized grain is skidded into the discard.

Still a chance of oversight?

Before these grits finally take up their finishing role on the ready-for-use Speed-grits they must pass a final test before a board of "Detective" screens—exacting chaps that search carefully all over again for that one chance oversize grit, the grit that might do the damage on some delicate polishing job. And all this grading is just one of the Manning processes that put the "difference" into Speed-grits.

Small wonder that Speed-grits are depended on in the world of abrasives, wherever there is polishing, grinding, or cutting to be done—small wonder that "Good Workmen Know the Difference."

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

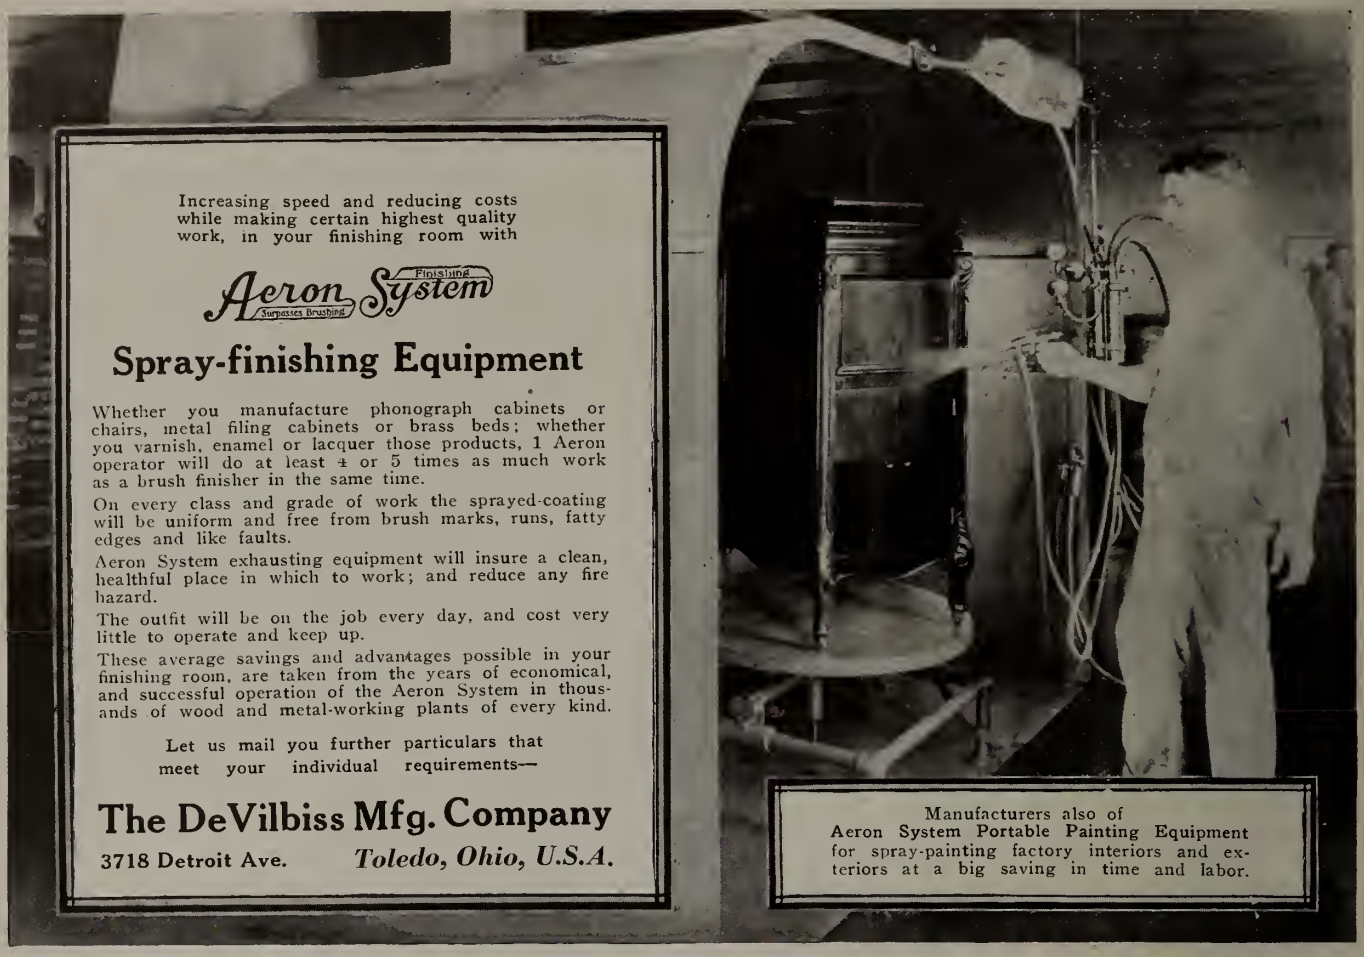
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron Finishing System
Surpasses Brushing

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

Veneers and Panels

Decoration Applied to Veneering

The Inlaying or Planting-on of Fine Veners Adds to Beauty of Finished Article— How This Work is Carrried Out

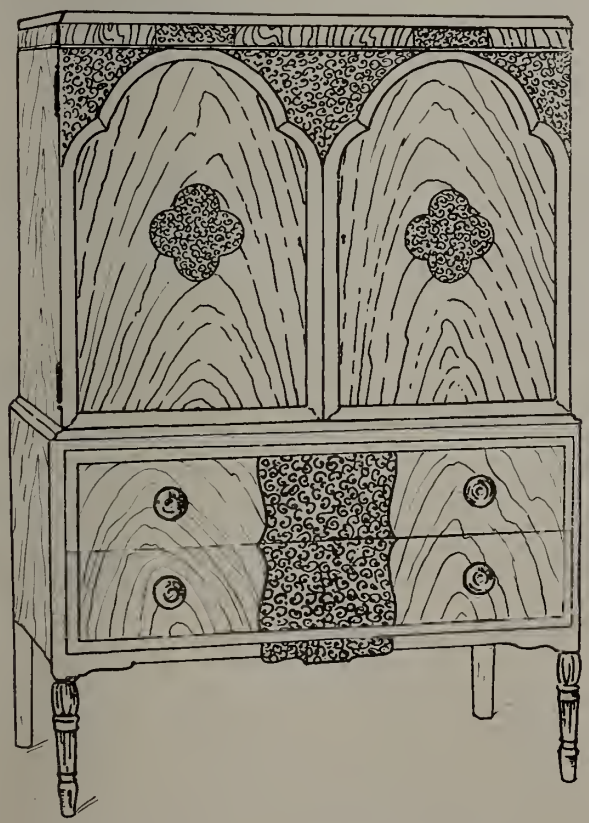
By John Welmers

There is an old saying,—"Fine feathers make fine birds," which might apply equally as well to furniture if changed to "Fine veneer makes fine furniture." For what is a mahogany, walnut or oak piece of furniture if it is not made with attractive veneers?

It is true that the styles are determined by the outline, the contour of the legs, the mouldings and various carvings, but if a person is buying a suite of furniture, does he only look at these things? Indeed not, unless he is contemplated buying an enamelled suite. Even then he is inclined to look at the finish and color of the ornamentation and antiquing, if there is any.

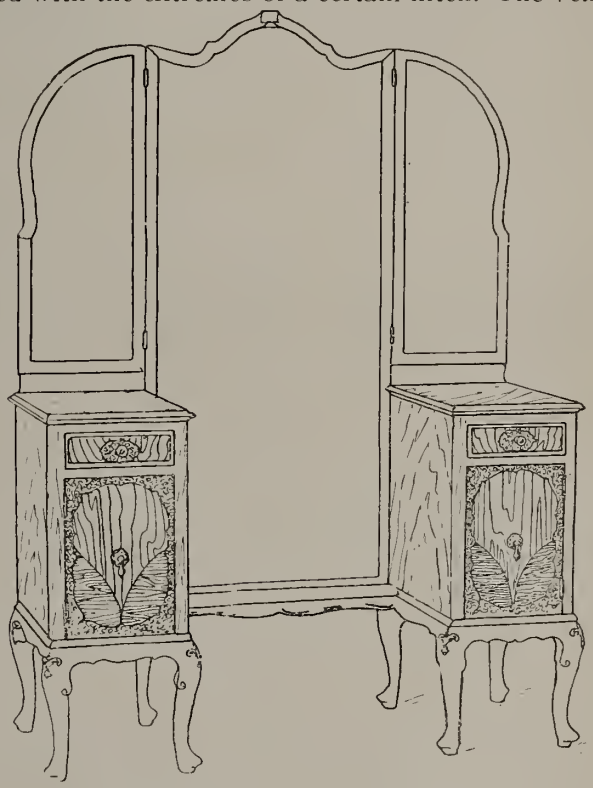
Variation in Veneer Figure

The quality of veneer is the one thing that most buyers are interested in, so why should not the veneer receive particular attention in view of harmonizing the grain with the design of the furniture? It is easy



An adaptation of Hepplewhite design showing inlaid veneers

to say that the veneer should harmonize with the design of the furniture, but due to the fact that veneer in the same log is not all alike, the task of sorting veneers from various logs is presented, and it is often difficult to get the veneers from two logs to match very closely. Veneers in the same flitch often differ to such an extent that some pieces would be hard to sell if the buyer had his choice between the cases veneered with the extremes of a certain flitch. The veneer



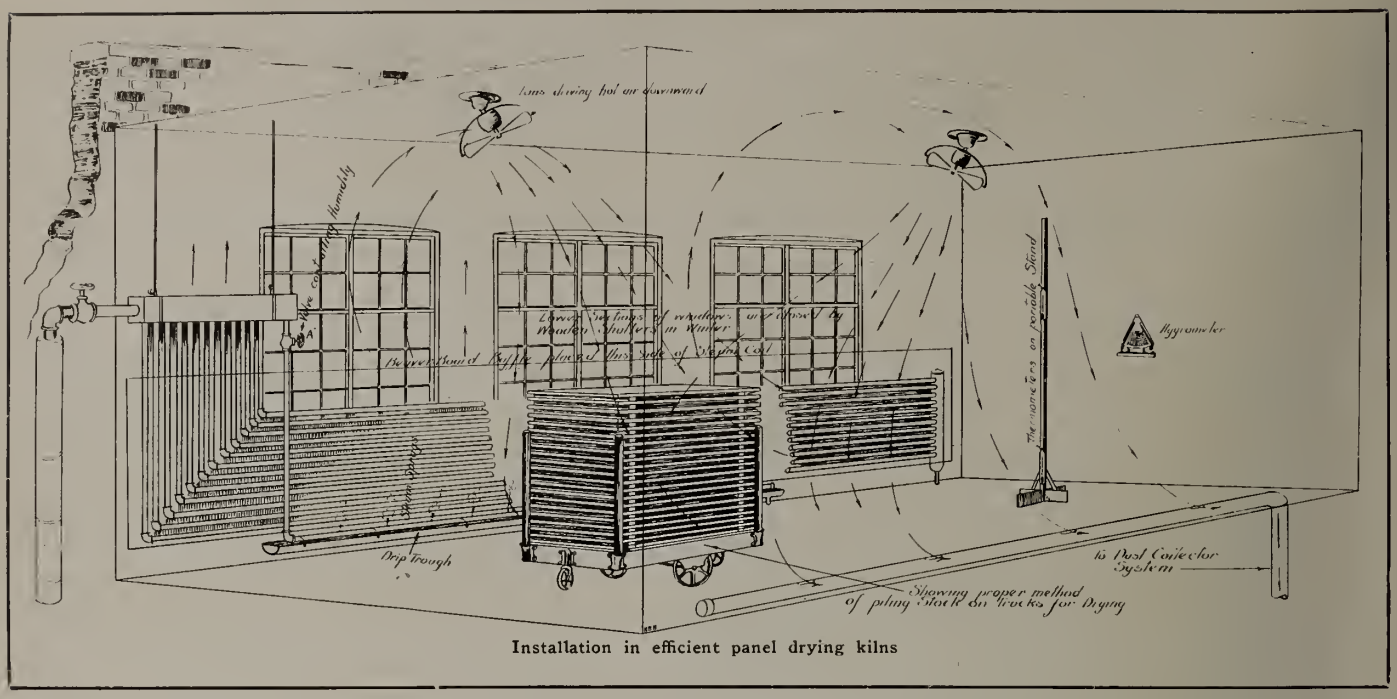
Dresser with Queen Anne motif showing fancy overlays

cut from the centre of a log is generally full of life and color while the one from the edge is often dull and lifeless.

There is one form of veneering which if properly termed, would be "decorative," for it really is used as such. It is composed of veneers of various woods and designs, which are either inlaid or merely planted on and form a very interesting phase of veneer work from both the practical and artistic standpoint. The two sketches shown herewith illustrate this phase of veneer work nicely, the chiffonier being a Hepplewhite reproduction with inlaid veneers, while the vanity dresser is ofthe Queen Anne period and shows the overlay work. In the chiffonier are burl walnut patches inlaid in a rich mahogany background, while on the vanity dresser are seen the small patches which form a setting for the pulls and also the band of veneer which forms a border for the doors and sets them out as no frame could.

The methods of preparing the patches and glueing them on may differ somewhat but the principles are practically the same. In the first place, the veneer, from which the patches are to be cut, has to be prepared

(Continued on page 188)



Installation in efficient panel drying kilns

How One Firm Overcame Veneer Checks

Strict Attention to Details of Every Operation, Together with Drying in Specially Constructed, Humidity Controlled Kiln, Solved Problem

By H. B. Beattie.

It has been said that much learning maketh the flesh weary and of the making of books there is no end. How about the making of built-up veneered stock, five-ply panels or tops, perfectly, the year round, even with the help of all the latest machinery? It not only maketh the flesh weary but it often causeth mutterings from out the mouths of operators and management alike.

Much has been done to fool Dame Nature in the preparation of wood to adorn the home of mankind, and much remains to be done, for some of us at any rate. Here we have a batch of beds, several have badly checked panels weeks after they are "in varnish." Several extension table tops gone in the same way even after the utmost care has been taken by all hands to insure a perfect job. These little occurrences cause you to sit up and take notice,—you slightly improve your system. A little more attention is paid to the core stock, and you perhaps delve into the secrets of your vegetable glue, yet you might spend a few minutes "looking wise" over your veneer department machinery, and put a dab of improvement here and there, and then sit back and await results.

And anon! Results, good, bad or indifferent. You might even get a severe jolt. I did—then tried this:

Strict Attention to Core

Going out to the dry kiln it was suggested that the 4/4 chestnut used for core stock was not steamed long enough to dissolve the minute particles of congealed sap in the pores of the wood, so that during subsequent drying this would not be all drawn off, and might prove a factor against good veneer work. say "might" for I am not just sure yet of the effect, if any, of the tanic acid in the sap on vegetable glue. However, we now steam our chestnut core stock the prescribed time. Following on into the breaking out department, we are careful not to plane our glued-up stock until the joints are thoroughly dry. I find that it takes as long as four days for animal glue joints, say in a top, 60 in. x 22 in. x ¾ in. to thoroughly dry out, that is in ordinary factory temperature. I have read of this and then proved it to my own satisfaction by weighing cuttings from the centre of test pieces.

The reason for not planing until the joints have dried out is that the swelling of the wood along these joints, caused by the moisture in the glue, forms a slight ridge hardly discernible. However planing too soon cuts away that ridge, then when the joint does dryout and the wood shrinks to normal there is a slight depression that often shows up on veneered work in varnish.

Even Glue Spread Important

In veneer department, before cross banding of birch or poplar is laid on, all worm holes or other depressions are filled with reliable crack filler. In running the core body through the glue-spreading machine, great care is taken to see that the spread is neither too heavy or too light, and that the surface is all uniformly covered. After cross-banded stock is removed from press or retaining clamps, it is piled upon trucks for several days between strips. Then as 1/24 poplar or 1/20 birch is often sliced roughly, the face side is put through the triple drum sander with just enough pressure on the feed rolls to move the stock along, otherwise the edges would be rounded over and the face veneer could not be squeezed down. While this makes extra handling it is a saver in the long run, as you are absolutely sure of a good foundation for the face veneer, whether it be crotch mahogany, butt walnut, or the common log-run variety.

All veneer joints are made on a Jenkins veneer jointer and then taped together on a Preston taping machine. After face veneers have been laid and pressure applied, stock is left in retaining clamps all night

and in the morning these are knocked off and stock is piled between stickers or strips on trucks. There it remains for a day to air dry, then trucks are shoved into a drying room, (see sketch), where temperature and relative humidity are controlled and registered by means of a "hygrometer." (This name is taken from a Greek compound meaning "moist measure").

Details of Veneer Kiln

Fans fastened to the ceiling and inclined downwards at an angle to force the rising hot air down onto the floor, and at the same time creating a circulation. The heavier moisture-charged air is drawn off at the floor level by a pipe connected to the dust collector system. Fresh air is drawn in through two opened windows (opened about 3 in.) During the winter months these openings will be covered with light factory cotton. The humidity is controlled by having a separate pipe connected to the steam heater. (see (a) on sketch), and run down to within 6 in. of the floor, then along horizontally for about 12 ft. At intervals of 15 in. there is a 3/16 in. hole drilled in the pipe, to allow escape of steam. A galvanized iron trough is placed underneath the entire length of the horizontal section of this pipe to catch the drip. This is emptied by a pipe leading away at the low end. For this and many other valuable suggestions I am indebted to Mr. E. U. Kettle of the Grand Rapids Veneer Works.

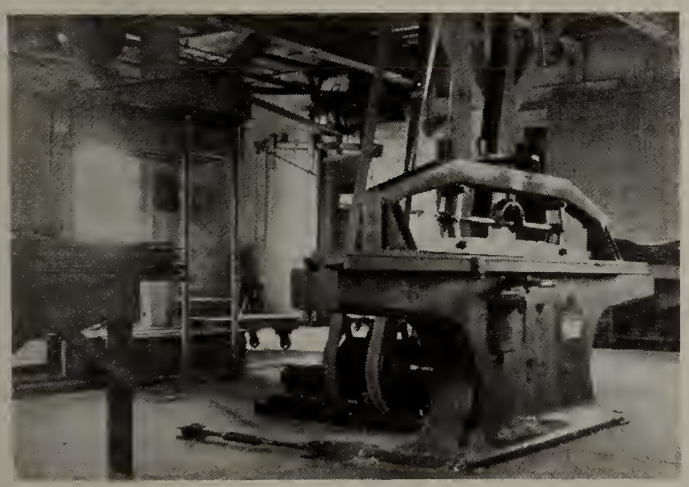
Two extra thermometers are hung upon a stand. One 6 ft. off the floor and the other 1 ft. off the floor to keep a check on uniform temperature. If the fans were turned off, for example, the temperature in the first 18 or 20 in. of space off the floor would be in the neighborhood of 90°, while the temperature above this level would vary according to height from 100° to 120°. This would mean that the stock piled near bottom of truck would be 10 to 150° cooler than stock piled on top, causing uneven drying. This noticeable difference in temperature is brought about by the ventilating pipe drawing the air off at the floor level, and the natural tendency of the hot air to rise. The proper condition for the drying room is 105° temperature, with 40 per cent. relative humidity, and stock will dry out to 6 per cent. or 7 per cent. in four or five days. This system is proving quite satisfactory.

A Better Way to Joint Your Veneers

Past and Present Methods Compared—Modern Veneer Jointing Equipment Increases Production—Accurate Work and Lower Costs

By W. Marsh

Years ago when the writer first made his acquaintance with the veneering industry, the almost universal method of jointing veneers was by hand. A "shooting board," a couple of handscrews or "go bars" and a jointing plane were the tools used. I think it is needless to describe at length what is meant by a "shooting board." This appliance is undoubtedly familiar to all cabinet workers. It is simply a piece of board with another piece several inches less in width secured to its surface. The veneers are laid flat on this top piece and allowed to project a quarter inch or so, depending on how straight or how crooked the edges are, so that the hand jointing plane may be pushed backwards and forwards on its side on the lower board.



Jenkins veneer jointer in St. Thomas Cabinets plant, St. Thomas, Ont.

This "shooting board" is, of course, placed on a bench when in use; a strip of wood is placed on top of the veneer and the whole thing held rigid on the bench with hand-screws or "go bars." The latter method is perhaps the best, as it is usually only possible to put a hand-screw at each end, whereas, the "go bars" can be placed on the ends and also on the centre. These "go bars" are simply strips of wood, usually elm, which reach from the bench to the ceiling, or an overhead platform. The pressure is obtained by bending them in the centre. This method of applying pressure is used extensively in glueing the ribs, or diagonal strips, on piano sounding boards.

Buzz Planer Used.

Jointing veneer by this method is very slow. About two dozen sheets are all that can be handled to advantage at one time. Frequent tests with a straight edge are necessary to show the workman when the joints are perfect. As is the case with many other hand methods, the results cannot be excelled, provided a mechanic does the work, but the output per man is so small, and therefore costly, that jointing veneer with a hand plane is out of the question in a plant where any amount of veneering is to be done.

A great many factories have used, and some are still using, a buzz planer for jointing their veneer. This method is faster than the hand plane, but is not to be compared with a regular veneer jointer, either in capacity or the quality of the joints. To joint veneer on a buzz planer it is necessary to grip the stock between boards and secure it with hand-screws. If the tables are properly adjusted and the knives are in perfect condition, a very good joint can be made on straight grained veneer. If the grain is not perfectly straight, it is almost impossible to avoid chipping and the smallest imperfection in the edges of the veneers makes an unsightly joint, when two pieces are taped together.

Special Machine the Solution.

Where a buzz planer is used by other workmen for jointing and facing off lumber, it is nearly impossible to keep it in fit condition for jointing veneers. It would

seem logical then to install a buzz planer for the sole use of the veneer room. But if this plan is adopted, why not go a little further and install a veneer jointer. It will cost more than a buzz planer, perhaps twice as much, but if output is a factor, it will save the difference in cost for the purchaser within a short period.

The writer is familiar with two types of veneer jointers. On one of these the veneer is placed flat on the bed of the machine and fed through by travelling chains. These chains are about three inches in width and have milled links. They are similar to the chains on the fast feed edging and jointing saws now in extensive use. The jointing is done with a saw and a cutter head. The saw takes off the rough edges and the cutter head makes the joint.

This is a good machine on flat veneer, but the

View of veneer jointer in plant of Midland Woodworkers, Limited, Midland, Ont.

writer's experience has been, that it "falls down" on veneer that is not perfectly straight. I believe this is due to the following reason: in carrying the veneer past the cutters, the top chain just exerts pressure on the edge with the result that if the stock is not perfectly flat, it twists around and does not pass through in a straight line. It has also been found that the chain feed is not suitable for veneers that are to be butt jointed and the writer is acquainted with a plant using this type of machine where they have to resort to the hand plane for jointing veneer that is in any way buckled and also veneers that are to be butt jointed.

Another Type of Jointer.

The other type of veneer jointer I am familiar with is made by the Jenkins Falls people. It operates on an entirely different principle. The veneer is clamped and held flat in a carriage which travels past the cutter. The cutter used is a special type of jointing saw. The edge of the table where the saw runs is bevelled and as the saw runs close up against this bevelled edge, with just the proper clearance, there is very little danger of chipping the veneer.

If a piece of waste veneer is placed on the outsides of the stock being jointed, perfect joints are obtained and the machine handles straight veneers, twisted veneer and butt joint stock with equal facility. The travelling carriage stops automatically according to the length of the stock being jointed. Then the operator throws in a clutch and the carriage returns to the loading point.

A veneer jointer is indispensable in any plant doing a quantity of veneering, although, too often, factory owners have been prone to give all their attention to machines that would increase the quality and capacity of their machine room work to the exclusion of the veneering department. If a properly balanced organization is the aim, it is obvious that the veneer room should be considered as part of the whole, rather than as a side issue.

Embarks on Aggressive Policy

Among the new advertisements appearing in this issue will be found that of the Williamson Veneer Co., Inc. of Baltimore, Md. This is one of the older and best known veneer companies in America, but heretofore they have been content to build conservatively, but well, doing business for the most part through jobbers. A change has been made in the methods of this company, with the result that an aggressive, direct-to-the-trade policy has been established

This firm was founded in Indianapolis more than half a century ago, as the Adams & Williamson Veneer Company, Marshall D. Williamson being the prime organizer. Mr. Williamson was an experienced veneer man and took an active interest in all departments of the business. Many improvements in methods and equipment are credited to his knowledge and practicability. He has since been succeeded by his son, Dwight W. Williamson, the present president, and his grandson, Roger W. Williamson, vice-president and sales manager.

In 1900 the plant was moved to Baltimore and in 1904 it was completely destroyed by fire. A new and larger plant was established, which consisted of six modern buildings; cutting mill, sawmill, dryhouse, warehouse, power house and office building. The installation consists of a seventeen-foot, two-inch slicer, three ten-foot rotary lathes and two sawmills, together with the other necessary equipment.

The Canadian business will be handled through the Jameston office, where Mr. Edward McGinley is in charge. R. J. Cavanagh will handle the sales in Chicago and vicinity. H. C. Livingston will be in charge of the New York office and C. J. Cummins will work out of High Point, N. C.

Vegetable Glue Patents Sustained

Last year the Perkins Glue Company brought suit against the West Michigan Furniture Company and Hood & Wright, in the U. S. District Court at Grand Rapids for infringement of the Perkins patents. The cases were tried in October, 1919, and the Court on September 10, 1920, handed down its decision upholding the patent and declaring both concerns to have infringed, and granting to the Perkins Company any injunction against further infringements and an accounting for profits and damages.

Talking Shop

"Life is a hard grind," said the emery wheel.

"It's a perfect bore," said the auger.

"It means nothing but hard knocks for me," sighed the nail.

"You haven't so much to go through as I have," put in the saw.

"I can barely scrape along," complained the plane.

"And I am constantly being sat upon," added the bench.

"Let's strike," said the hammer.

"Cut it out," said the chisel.

And all was silent.

HOLT TRACTOR No 1

HOLT TRACTOR No 2

A half century ago this company was founded on its present site. Today the popular idea is that Indiana and Ohio are devoid of timber. The extensive logging equipment here pictured is but the mechanical end of our logging department, all operating within a radius of 100 miles of our Indiana mills, and hauling northern grown Oak, Walnut, Ash, and other high-grade logs to the railroad. These machines with a full complement of trailers and animals will be so occupied for years.

Since its inception, the company has never been out of the family, and therein lies it strength. An intimate knowledge of all supplies of virgin growth northern timber makes possible an unceasing flow of as good logs as we cut fifty years ago.

Efficiency in manufacture has become traditional in our organization. The genuine and the perfect in northern grown hardwoods are our pride.

THERMOSTATICALLY CONTROLLED STEAMING VATS

THERMOSTATICALLY controlled steaming vats correctly prepare veneer logs and flitches for cutting. While not all important in themselves they reflect thorough care and knowledge throughout the manufacturing processes.

This one point is typical of every unit in our extensive hardwood lumbering and veneer operations. The entire equipment behind our band mills; the facilities accessory to our veneer operations are all carefully planned to attain the best results.

Our timber represents the critical selection of a trained timber department, including twenty experienced timber buyers. The lumber is cut in four modern mills equipped with five band saws. The veneer logs and flitches are converted at three plants operating an unusually large battery of saws, slicers and rotaries.

The product we offer consists of the best obtainable white oak, walnut, poplar, ash and other hardwood lumber, sawed quartered white oak veneers, sliced and rotary cut walnut veneers and rotary cut yellow poplar crossbanding.

Each product is made in an especially designed plant. The extent of our organization gives satisfactory guarantee of service to buyers.

WOOD-MOSAIC COMPANY

Decoration Applied to Veneering

(Continued from page 171)

so as to be easily worked and handled, for it is usually of the brittle kind. The preparation consists of coating each side with glue size and then glueing a piece of gauze or cheesecloth on to them. This is done as follows. the first glue size is put on, then they are laid between basswood cauls and dried flat. They have to be changed and turned over frequently to prevent their sticking to the cauls. After the preliminary drying, warmed cauls may be used to speed up the drying, after which they are given a coat of glue on the back side and a piece of the gauge is spread on it and pressed down by means of wetted fingers. Then it goes through practically the same drying operation again to dry the glue. Now it is ready to be cut and made up into the various shapes.

In cutting out the various shapes it is necessary to put a number of the veneers together, as many as can be conveniently handled at one time. Then a 3-ply panel is placed on the top and bottom of the veneers for the purpose of binding them closely together. Needless to say the nails are driven in places that will be cut away. Then the pattern is marked on the top panel and the set is ready to be bandsawn.

Requires Sample Work

The nails and panels not only form a means of holding the veneers together but also keep the bottom edges smooth where they would otherwise present a jagged appearance. A smooth edge is very essential in both the inlay and overlay types for reasons which are very apparent. Now that we have the patchwork cut out, we will find that the methods of glueing them on are quite similar in some respects to the glueing on of mouldings.

The inlay work, however, usually requires the services of an expert, but where the designs are not too intricate, a careful band and jig-sawyer can accomplish a great deal. In the inlay work the face veneer is always prepared with the inlay before being glued to the crossbanding or core, the two being held together with stripes of gummed tape or paper, which should be placed on the face-side for they have to be taken off again after the panel has dried. With the overlay, however, the glueing takes place after the panel or piece to which they are to be glued, has been veneered, sanded and polished, for after they are once glued on, it is no easy matter to sand around them.

Small patches, such as are seen on the vanity dresser drawer front, can be glued on very easily, but where they are glued to surfaces, such as a bed-head or foot panel, a different problem is met with, for they are generally so large and unwieldy that clamps and handscrews are of little use. A small veneer press comes handy for such work. Another wrinkle that is used quite frequently where only a few pieces have to be laid, is to place the panel on a bench or a set of horses and glue the patch down by means of a stick which can be tightly wedged between the ceiling and the block covering the patch.

Joints Require Care

Borders, such as shown on the Queen Anne vanity dresser, are not always mitered as some readers might think. They are cut so as to allow the least waste. The joints are cut quite closely on the bandsaw and smoothed up on a shooting-board or a bench miter block. Sometimes they are cut to fit with a wide sharp chisel and a smooth cutting block. Then when all sides are fitted they are glued on and held in place temporarily with small veneer tacks, the heads of which are nipped off close to the veneer.

After both sides of the two doors are thus laid they are placed with their faces together, being separated by a sheet or two of paper to prevent them from sticking together and are then placed in a small press or squeezed with handscews. The nails are so small that they need to be taken out. Instead they are driven down into the panel with a small nail-set.

The faces of front post are often decorated by means of these patches, and if correctly designed, present a very attractive appearance. The methods for glueing these on, differ the same as all others and it can generally be left to the pressman's ingenuity to find the most efficient way of laying them.

Panel Plant at Southampton

One of the newer additions to the industries of Southampton, Ont., is the factory of Panels, Limited. As the name indicates the efforts of this firm are devoted to producing a line of panels and plywood in different woods and different thicknesses. About sixty hands are employed at present and the output runs about 5,000 feet of built-up stock each day. When running to full capacity this figure can be doubled. A very complete plant has been installed, including the latest in panel making equipment. In addition, certain woodworking machines were included to facilitate the manufacturer of cores.

The output includes built-up stock in all the figured and commoner woods. Many of the orders filled are for stock, sanded and sized, for such articles as phonographs, case-goods, doors, interior woodwork, in fact panels for all purposes, including the cheaper lines for case tracks, drawer bottoms and similar items.

Mr. J. H. Hande, manager of the Toronto Veneer Co., Limited, Toronto, Ont., is managing director of Panels, Limited. As a matter of fact the two companies are practically identical though incorporated and conducted as two distinct organizations. At the present moment Mr. Hande states that business is a trifle quiet, though he looks for an early resumption of buying.

Paper from Veneer Waste

In the wood waste from veneer factories the U. S. Forest Products Laboratory sees considerable raw material suitable for the manufacture of high grades of paper. The cores of many kinds of veneer logs, now used in a large part for fuel, would make excellent pulpwood. In addition, a large part of the clippings and small veneer waste, which amount to 1/5 of the total veneer cut, probably could be turned into pulp stock with profit.

Among the veneer woods whose waste has paper-making possibilities are red gum, yellow poplar, cottonwood, birch, tupelo, basswood, and beech. Many veneer factories cutting these species are already within shipping distance of pulp mills. In certain other cases, veneer factories are so grouped that they might furnish pulpwood enough to warrant the erection of a centrally-located mill. Other economic factors being favorable, such a mill could profitably operate on a daily supply of veneer waste equivalent to 50 cords of ordinary pulpwood. Of course, the construction of a mill should be undertaken only upon the advice of a competent mill engineer after a careful survey of local conditions.

THE ARTISTIC TOUCH

In the manufacture of furniture and panel work; smooth perfect surfaces of beautiful designs that contribute that artistic touch of beauty are essential to meet present demands.

We carry a complete range of American Walnut, Mahogany, Quartered Oak (in all thicknesses) Figured Gum Veneers, Rotary Cut Veneers in all the popular woods.

Large stocks always on hand for prompt shipment — write today for prices.

How St. Thomas Cabinets Make Panels

Up-to-Date Panel Making Equipment—Prefer Birch Crossbanding for Panels —Special Formula for Mixing Glue—Efficient Drying Room Constructed

By Jos. Bone.

When the St. Thomas Cabinets, Limited, St. Thomas, Ont., were purchasing machinery for their phonograph factory, they made a point of securing the very best equipment available, for a thoroughly up-to-date veneer department. Of this department much was expected. It was to be more than a mere auxiliary, but was to keep pace with the other departments, prepare panels for all the cabinets framed in the cabinet shop, and, in addition, to undertake the manufacture of panels for other firms who were not in a position to lay up plywood for themselves.

It made good, it kept pace and its output for the last eight months has been exceptionally large. Two carloads of veneers per month have been cut up and converted into panels in this busy department. Coincident with this large production, a certain amount of experimental work was undertaken, with the result that to-day the department boasts of being able to turn out panels as good as ony on the market, and as nearly perfect as the yet limited knowledge of the art of panel-making permits.

The ideal oak panel, according to the specifications of the St. Thomas Cabinets, if 3/8 thick and of 5-ply construction, is as follows:—3/16 in. poplar core, 1/20 in. oak face veneer, 1/20 in. birch,or maple back veneer, and 2, 1/20 in. birch cross-bands. If a walnut or mahogany panel is being made, gum veneer will be used on the back. For panels ½ in. thick or over, the St. Thomas people recommend that chestnut core with 1/20 in. birch cross-banding oak face and birch back, or walnut and mahogany face with gum back.

In making 5-ply panels the St. Thomas procedure is as follows:—A press truck is drawn immediately in front of the glue spreading machine and a press bottom, made of 3-ply 13/16 maple, placed upon it. The cross-band material and cauls are placed upon tables situated convenient to the men behind the spreader. The core stock is placed on another table behind the spreader. As the cores pass through the machine the 3-ply stock is built up on the truck with a 3-ply wood caul sandwiched between each layer. The load is topped with a 3-ply 13/16 maple press piece and run into the hydraulic press. This operation is performed with the utmost despatch.

Pressure 100 Lbs. per Square Inch

In the press the panels are subject to a pressure of 100 lbs. per square inch, if under ½ in. thick, and to 90 lbs. per square inch if over this thickness. After the panels are withdrawn from the press, they are allowed to stand for twelve hours in the retaining clamps. When released from these, the stock is passed through an endless bed sander, and smoothed to uniform thickness. The panels are then transferred to a specially-constructed drying room, stacked in piles with sticks between each layer and weighed down with heavy weights. This room is maintained at a temperature of 90 degrees and the stock is usually left in for a 36-hour period.

The drying-room is well ventilated and is provided with two fans. One of which the fresh air is from the outside, sending it through the heating coils, while the other is used to expel the moist air. From the drying room the panels are taken back to the veneer department where they are again passed through the spreader and the face and back veneers laid.

Worked Out Own Glue Formula.

The glue used is Perkins "183" vegetable glue. After much experimenting, the following formula has been found to give the most satisfactory results: Glue 120 lbs., water 202 lbs., solvent 4 lbs., water 14 lbs. The 14 lbs. of water for the solvent is first heated to a boiling point and the solvent added and stirred until dissolved. The 202 lbs. of water for the glue is poured into the cooker, the glue and solvent added and the mixture cooked under 180 lbs. pressure for about two hours or until such time as it has attained a light amber color. Cold water is then injected into the steam jacket and the mixture cooled off. The cooling usually requires half an hour. In mixing the glue, care must be taken to see that the water used is absolutely pure. Sometimes as an experiment this formula is varied, but invariably the results are not so satisfactory as when the glue used is mixed as above.

The St. Thomas people pin their faith on 3-ply, wooden cauls. These are coated with a solution of paraffine wax and light oil once a week and cleaned off every time they are used. They find that the best results are secured in a veneer department which has a wooden floor. On no account should a basement with cement floor be used, as a veneer room for a uniform temperature in this department is absolutely essential to good results.

Unique Veneered Effect

The term "oyster wood" is not applied to any particular variety of timber but to the method in which the wood is employed. Any firm wood showing stripe is suitable for conversion to what are termed oyster veneers.

The oyster veneers are usually from the boughs of walnut, or similar wood, five inches or six inches in diameter; the veneers are cut across the grain, showing the complete rings of the wood, and the angle at which they are cut is somewhat oblique, the resultant veneer being oval in shape.

The sapwood is left on the veneers, which are trimmed to fit into each other when applied to furniture, and are called oysters from their resemblance to the shape of oyster shells.

The oyster method of veneering is somewhat "freakish" and is not generally recommended, as the end grained wood is almost certain to split, and the appearance of furniture so treated is not always of the best after a time.

However, the oyster method of veneering was very popular during the Seventeenth Century and many pieces of furniture preserved from that period are ornamented in this way.

Are some of the supplies you ordered two years ago coming through without a word of apology for the delay?

The Demonstrable Quality of N. B. Veneer

There are certain objects which have the subtle quality of inviting the experience of other senses than that of sight. Wood is one of these. That is why there is always an instinctive impulse to touch, to handle and to feel any beautiful creation in wood.

This is one of the reasons for the popularity of N. B. Quality Veneer. Its smoothness entirely satisfies the sense of touch, thus emphasizing the quality which is manifested in its appearance.

Do Western Woods Make Good Cores?

Writer Does Not Agree with Coye in September Issue—Sitka Spruce Did Not Work Satisfactory—Investigate Thoroughly Before Adopting New Wood

By S. H. Johnstone.

Have you used or experimented with such woods as spruce, cedar, pine and California redwood for cores. If so, will you kindly send in outline of results secured, giving the advantages or disadvantages which you noticed.—The Editor.

In an article in the September "Canadian Woodworker" Philip Coye touches on the suitability of western woods for core stock. In his closing sentence he suggests that the eastern manufacturers do a little experimenting and satisfy themselves as to the behaviour of western woods when worked into panels. This is a very good suggestion—one that should be followed by anyone contemplating using three woods in ply work.

Some time ago the writer had an experience with sitka or aeroplane spruce as a core wood, and the results were not very satisfactory. This was in connection with the manufacture of phonograph cabinets. We had a quantity of this spruce on hand, and, acting against the advice of our veneer room foreman, decided to work some of it into cores for the cabinet doors. The lumber was nice and wide and gave an unusually high percentage of clear cuttings. Had it been suitable in other respects, it would have enabled us to reduce the cost of these cores. As intimated, the percentages of clear cuttings was high and owing to the width of the stock, we had less jointing to do, thus our cost of manufacture was lower. It certainly looked good and we had hopes of effecting a permanent reduction in our cost of production.

Panels Worked and Twisted.

All went well for a while. The spruce took the glue well and the veneers and cross-banding held tight. We piled the pieces away and left them to dry and equalize. These pieces were given identically the same treatment, which we gave to all our built-up stock. When the moisture was all eliminated, we dried them in a heated room, the stock was removed and started through the machine shop. Nothing out of the way was noticed until the pieces reached the assembly department. Here it was found that the majority of the doors were warped or twisted slightly. As this was largely an experimental lot, the warping was laid to the fact that the spruce might require longer to dry and thus was not in perfect condition when removed from the drying room.

Nothing daunted, a second lot was tried. This time particular attention was paid to the drying, the stock being left in until tests showed conclusively that the desired moisture content had been reached. These were then started through the shop with every confidence that the trouble had been overcome. Much to our chagrin when the assembly was reached, the same trouble was encountered. We tried several smaller lots with practically the same results, so gave it up.

The only explanation that we could give was that spruce was a "live wood," one that took up and gave off moisture freely, and owing to its life or liveliness, was hard to keep straight while taking on or giving off moisture. Chestnut is a comparatively dead wood and does not seem nearly as inclined to move and warp when subjected to atmospherical changes.

The table included in the article, to which reference is made, gave a percentage of shrinkage occurring in several woods while being dried from a green to oven-dry condition. Chestnut does not show the same amount of shrinkage as the majority of the other woods, but apart from that, the wood seems to lack life and thus is inclined to remain straight.

The explanation given may not be a scientific one, but as far as we were concerned, our conclusion worked out satisfactorily, for when we adopted chestnut as our core wood, the percentage of warped doors dropped to a negligible figure.

Might Prove Suitable.

There are two western woods, which might prove highly satisfactory for core work. They are both comparatively dead and not given to warping and twisting. These are Western red cedar and California redwood. Both are available in quantities, may be secured in good widths and in grades that will give a high percentage of clear cuttings. Before adopting either of these woods, some careful experimenting should be done, as suggested.

The core is the very foundation of the panel and deserves more consideration than it receives in most plants. Simply because it is covered and, therefore, invisible is no reason why any old grade and kind of wood may be used. The stock for the core should be chosen with as much care as the veneers for the office work. The lumber used should be dry, free from loose ends and wide cracks or checks. It should be of even texture and as far as possible of one kind of wood. One damp piece among the dry pieces will shrink as it dries out and cause a depression that will be visible on the finished surface. The same holds true if the core pieces are surfaced before the stock on both sides of the glued joints has dried out and equalized. The wood near the joints continues to give up its moisture and contracts in the process, leaving shallow depressions the full length of the joint. If not rectified by resurfacing the cores a second time, or if the veneer were applied immediately after the first surfacing, these depressions are likely to show when the panels are completed.

The point I want to make is this that while many different woods, including certain western species, may be entirely suitable for core work, it is not advisable for one to change from one wood to another on hearsay. It is certainly the part of wisdom to proceed carefully and do a little experimenting before making any radical changes. While different woods may give perfect results, yet each will, probably, require to be handled in a slightly different manner. Experimenting should show, if nothing else, the best way to work and handle each wood. It does not pay every time to make a change unless one is absolutely certain.

Walnut is steamed in these kilns to secure even color

How Walnut Lumber is Manufactured

Steamed to Secure Even Color—Labor-saving Equipment Employed—Stock Well Air Dried in Large Yard

THE equipment and methods used in the manufacture of walnut do not differ materially from those of any modern hardwood mill, but the Frank Purcell Walnut Lumber Co., Kansas City, Kansas, have worked out equipment and methods which they believe are not being used in any mill devoted exclusively to the conversion of walnut logs.

Due to the fact that walnut occurs at widely-scattered points and in small stands, their entire supply of logs comes in by rail. The unloading is effected by means of a huge derrick with a 70-foot boom. This permits of taking logs from the cars and placing them on the skids alongside the log tanks. The length of the boom gives sufficient range to properly sort and select the logs and gives a storage capacity of practically half a million feet of logs from the one derrick.

How Logs Are Handled.

As intimated, the logs are piled near the log tank. This is a huge concrete affair, filled with water. The logs are pulled through this before entering the mill, so that all grit and dirt may be removed from the bark.

A log haul-up of the chain type carries the logs from the tank to the log deck. Here a kicker is used to remove them from the log trough. The equipment in the mill proper consists of loader, steam nigger, 6-foot band mill, shot-gun feed, live roll system, a gang edger, an eight saw, 16-foot foot-controlled trimmer, slasher and a hog for reducing the slabwood and edging strips to chips for fuel. In addition to the band mill, a circular rig is operated to take care of the logs in which wire, nails, horseshoes and other hardware may be imbedded. The various steps and operations are arranged to permit of a continuous movement in one direction from the log haul-up to the placing of the lumber on kiln trucks.

Steamed For Even Color.

Owing to the fact that the logs are secured from widely-different localities, the color of the lumber is bound to vary. To secure a uniform color or shade in the finished product, a battery of twelve concrete kilns has been constructed in which to steam the lumber for various periods. This steaming period is varied according to the color and texture of the lumber going through, but usually takes about five days for a change of material.

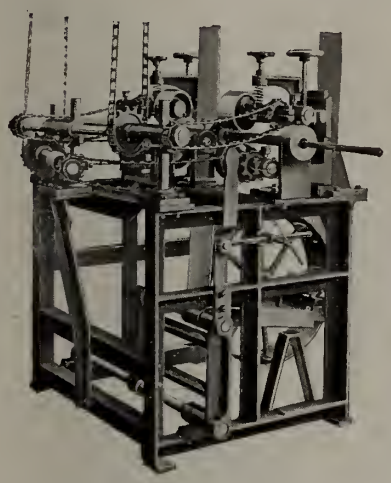
After the lumber leaves the trimmed saws, it is inspected and stencilled and then conveyed by a sorter chain to the dry kiln trucks. These trucks carry about 7,500 feet of flat piled lumber and are pulled into and out of the kilns by a cable and block system, the power for which is supplied by the mainline shaft. After about five days in the steam, the lumber is conveyed to the piling yard by a transfer truck system. The alleys of the yard are raised from 2 feet to 4 feet above the ground. The individual foundations for the lumber piles are also raised from 1 foot to 1 foot 1 inch above the ground level. This arrangement permits of a free circulation of air through the piles and is conducive to quick drying. The lumber yard lay-out is large enough to accommodate a stock of two and a half million feet of lumber and is taxed to capacity at the present moment. A strong effort is made to carry a complete line of walnut in all grades and in all thicknesses from 3/8 inch to 4 inches.

The power plant consists of two 125 h.p. boilers, which supply steam for a 125 h.p. Corliss engine. The

Band mill in plant of Frank Purcell Walnut Lumber Co., Kansas City, Kansas

BEATS THEM ALL!

An Automatic Machine for Sanding Handles Smooth as Glass
in the Twinkling of an Eye



No. 75 Rapid Sander

The Rapid Automatic
Sanding and Buffing Machine

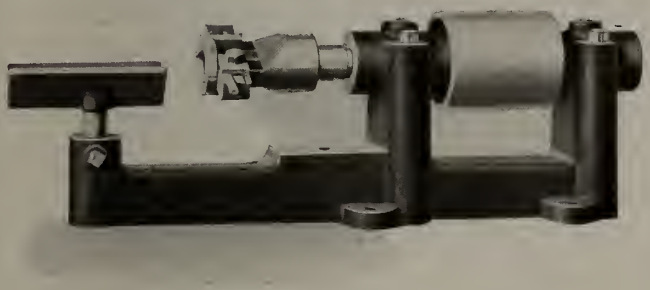
Quality: It will make your handles as smooth as the highest grade furniture, their beautiful finish aiding greatly in their ready sale at top-notch prices.

Speed: It sands turned stock at the rate of 70 lineal feet a minute, which lowers the cost per handle to next to nothing.

Method: The operation is automatic throughout. Large flat feed rolls, 6-in. diam. by 3-in. face, revolve the stock with such great rapidity against a single belt of fine sand cloth that it is all done with astonishing swiftness.

Capacity: Takes stock from 20 inches up to any length and ¼-in. to 1¾-in. diameter.

A machine to make your handle business pay
Will you not write for complete information?

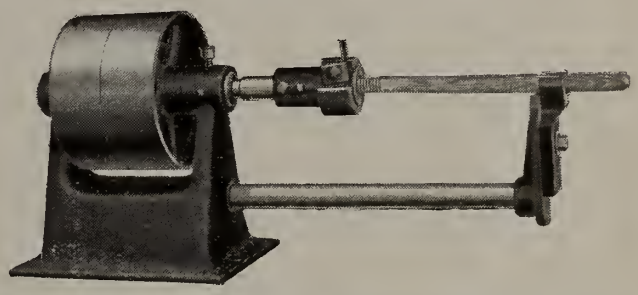


No. 31 Topping and Sizing Machine

For Topping all kinds of Handles & Chair Stock.

Will cut Tenons Straight or Tapering for all purposes.

Ask for full information.



No. 20 Automatic Threading and Tapping Machine

It will tap and thread all kinds of Wood-work such as Brush Blocks, Mop Handles, Sweeper, Duster, and all similar Handles, at the rate of from 20 to 30 pieces per minute. This work is done on all kinds of wood and a clean, perfect thread is always guaranteed.

Chucks and Taps made to order for any and all kinds of threads, from ¼-in. to 2-in. diameter, and any number of threads to the inch.

This machine is in use all over the world, giving perfect satisfaction in each and every instance.

Free samples of work and full information upon request. Write today.

OLIVER MACHINERY CO.
MANCHESTER, ENGLAND

A. R. WILLIAMS MACHINERY CO.
TORONTO and MONTREAL, CANADA

boilers are fired by a Palmer forced-draught slack burner system, the fuel used being the chips secured by running the waste through the hog. The boiler-room itself is of hollow tile and is thus fireproof. The mill, engine-room and store-shed is of mill construction covered with corrugated iron.

This progressive company was organized in 1919 as The Frank Purcell Walnut Lumber Co. to take over the business conducted by Frank Purcell for a good many years. The officers and directors of the new organization were all connected with the old business and brought with them a knowledge of walnut and experience in its manufacture that enables them to give good service both in the selecting of the material and the quality of manufacture. The officers and directors consist of Frank Purcell, president; D. H. Shelby, vice-president; George S. Shanklin, vice-president and general manager; Wm. J. O'Connor, treasurer; Francis C. Downey, assistant treasurer, and Frank J. Purcell, secretary.

Walnut logs awaiting conversion into choice lumber.

Prices Show Very Slight Decrease

In view of all that has been said and written with regard to lower prices, the big declines that have taken place and those which are scheduled to occur in the immediate future, the figures just issued by the Cost of Living branch of the Labor Department, and published in the Labor Gazette for October, are worthy of consideration. The average weekly food budget in sixty cities in Canada, at the middle of October, was $15.83, as compared with $15.95 for September, a decrease of 12c a week for a family of five. Not very much. The budget for October, 1919, was $14.21 or $1.72 less than in October, 1920. Comparing 1920 with 1914 the difference is just $7.90 or 100 per cent. higher.

The same holds true with regard to the departmental index number as applied to wholesale prices. October, 1920, it was 317.6 as against 326.6 for September, 1920, a decline of 9 points or under 3 per cent. The figure for October, 1919, was 299.6 for the same period in 1914, 138.7.

It is well to bear in mind when reading articles and opinions on price levels, present values and future declines that while in Canada the term pre-war prices or pre-war values is applied to those which prevailed at or prior to 1914. The same does not hold true with regard to the American use of the term, for they did not enter the war until 1917. Thus in an article written in America or of American origin the term pre-war is applied to conditions as existed in 1917, or prior to the entrance of the United States into the European conflagration, a vastly different situation to that which existed in 1914.

Making Wood Buttons

The wooden button industry in the United States has received a decided impetus, as a result of the activities of the Government in the prosecution of the war, according to the United States Tariff Commission. The centre of this industry is in Providence, R.I., although some wooden buttons are being made in other Eew England cities.

Before the war the industry had an extensive foreign trade, exports going to England, Germany, France, Belgium, Austria and South America. England was perhaps the largest customer until shipments ceased, as a result of Great Britain placing an embargo on the enamelled wooden button.

White birch from the forests of New England provides the raw material for manufacturing these wooden buttons. The trees are cut in the winter, and the logs are sawn at the mills into squares 4 ft. long, each side measuring from ¼ in. to 4 in., the squares differing in size by 1/16 in. They are seasoned or cured for about six months so that the wood may be worked into all shapes. At the factories these squares are known a "spool stock."

Safety Work and Industry

Today, accident prevention is the one non-controversial subject in industry as both employer and employee are interested in preventing accidents. Compensation costs are a big item in modern industry and yet both employer and employee would be better off if there were no accidents. Compensation at its best can never replace a limb lost nor can it bring back a life lost in industry. Manufacturers in England and the United States have come to realize the importance of accident prevention and are getting very substantial results by placing this feature of their work on a strict economic basis.

Compensation is a substitute, accident prevention is the "real thing." As far back as the fifth century, compensation in money was paid for personal wrong. The freeman's life and the freeman's limb each had, under this system, its legal value. An eye for an eye, and a limb for a limb, or for each, fair damages. Accident prevention means whole bodies and lives saved.

Will Introduce Industrial Democracy

L. W. Sims, president of the T. S. Sims & Co., Limited, St. John, N.B., operators of one of the largest brush making plants in Canada, recently announced that they intend to introduce the principles of industrial democracy into their St. John plant. This company have made a careful study of the question of the relationship of employer and employee, and have worked out many ideas which have resulted in increased co-operation and an enlarged output. Some principles of the new relationship have already been put in force in the shape of a mutual benefit society. Further developments are to rest on the result of a study of industrial democracy, which is being made by Mr. Sims in several New England plants where this system is being worked out.

Information and Inquiries

You are cordially invited to make use of this department

Varnish Drying Kiln

Montreal, P. Q., Oct. 24, 1920

Editor "Canadian Woodworker"

We plan on installing a varnish drying kiln in our piano factory and would be glad if you could put us in touch with a Canadian firm who specialize in this line. Thanking you in anticipation, we are

Yours truly,

The Pratte Piano Co., Ltd.

As far as we know there is not any concern in Canada specializing in varnish drying kilns. The A. S. Nichols Co., 33 W. 42nd St., New York make a very efficient type of varnish drying kiln. A description of a Nichols installation in the finishing room of the Heintzman Piano Co., Toronto was published on page 62 of the January, 1920, "Canadian Woodworker." Would suggest that you get in touch with the Nichols Co. We believe that several other American firms devote their attention to varnish drying equipment.

Period Table and Chair Legs Wanted

Grimsby, Ont., Oct. 15, 1920

Editor "Canadian Woodworker"

Will you kindly furnish me with the names of a few Canadian manufacturers who are making table and chair legs in the different period styles for the trade?

Yours truly,

G. Lander

We do not know of any Canadian firms who make these articles, other than for ther own use. The Jefferson Woodworking Co., of Louisville, Kentucky, specialize in this line and should be able to take care of your requirements. Their advertisement appears in this paper. There is a possibility that the Brantford Pattern Works, Brantford, Ont., is in a position to handle this work.

Wants Upholstering Springs

Chatham, Ont., Oct. 25, 1920

Editor, Canadian Woodworker:

I am in need of a quantity of upholstery springs, and was wondering if you could tell me where I could secure them.

Yours truly,

A. Dunn.

James Steel & Co., Guelph, Ont., the Waterloo Spring Co., Waterloo, Ont., and the Ideal Fence & Spring Co., Limited, Windsor, Ont., manufacture upholstering springs in different sizes and quantities.

Manufacturers of Bent Goods

Toronto, Nov. 8, 1920

Editor "Canadian Woodworker"

Will you kindly give us the names of some firms, in Canada, who manufacture bent goods?

Yours truly,

Kilgour Davenport Co., Ltd.

The following manufacturers make a line of bent goods: J. Finlay, Son & Co., Norwood, Ont.; Forest City Bent Goods Co., London, Ont.; Merritt & Co., Chatham, Ont.; and F. W. Hore & Son, Limited, Hamilton, Ont. You might also try the Brantford Pattern Works, Brantford, Ont., as they make a line of wood novelties and bent goods.

In Market for Table Slides

St. John, N. B., Oct. 15, 1920

Editor "Canadian Woodworker"

Will you kindly furnish us with the address of a few Canadian firms who are supplying table slides, for extension tables, to the trade.

Sincerely yours,

J. Fred Emery.

The Bruce Woodworkers, Limited, Chesley, Ont., are equipped to manufacture this line. Many furniture manufacturers have been securing their slides from the B. Walter & Co., Wabash, Indiana or the Jefferson Woodworking Co., Inc., Louisville, Ky.

Birch and Oak Panels

Regina, Sask., Oct. 22, 1920

Editor "Canadian Woodworker"

We would like to get in touch with a number of Canadian firms manufacturing panels in birch and oak. Perhaps you can help us. Any information furnished will be appreciated.

Yours truly,

Regina Sash & Door Co., Ltd.

For panels in oak and birch, would refer you to Hay & Co., Limited, Woodstock, Ont., Toronto Veneer Co., Limited, Toronto, The Waterville Veneer & Panel Co., Limited, Waterville,, P. Q., and the St. Thomas Cabinet, Limited, St. Thomas, Ont. The Birds Eye Veneer Co., Escanaba, Mich, specialize in the production of birch veneers and panels.

Equipment Wanted

Hamilton, Ont., Oct. 23, 1920

Editor "Canadian Woodworker"

Can you tell us where we can secure a second-hand 20 band saw, also a 4" x 7" or 4" x 8" wood trimmer. Thanking you for your kindness, I am,

Yours truly,

E. Wright

Practically all the machinery firms advertising in this paper handle band saws, many of them might have a second-hand one that would suit your requirements. Would also refer you to the lists published in the classified pages. The J. A. Fay & Egan Co., Cincinnati, Ohio, make a line of wood trimmers in different sizes. A description of their wood trimmers appeared on page 85 of the September issue.

Excelsior Wanted

A firm in London, Eng., wish to get in touch with Canadian manufacturers of Excelsior. For the name of this concern write the publishers of this paper. Inquiry No. 2237.

Desires to Represent Furniture Manufacturers

A firm of manufacturers, agents in Port of Spain, Trinidad are desirous of representing some Canadian Furniture manufacturers. If interested write the "Canadian Woodworker" for name. Inquiry 2235.

SPOT

SERVICE IS AN ASSET *To any* LUMBER BUYER

CONSISTENTLY good service has for many years been one of the assets of our organization. This service is neither a myth nor a boast, but is based on real facts. In the first place the geographical location of our operation and timber, and our relation to trunk line railroads gives us the advantage in securing cars under all conditions. This was clearly demonstrated in the car shortage of this year.

In the second place, as the above map indicates, the flow of our product from the sawmills to all consuming points is smooth and uninterrupted. This holds good for export as well as for domestic shipment, and is an easily provable statement.

The third reason is that our entire organization was built about the one thought of offering unusual and unique facilities. Our product is diversified, offering a selection of about all southern hardwood forest products the average consuming factory requires.

This service should be especially helpful to buyers requiring quick shipment under present conditions.

OUR FOUR MILLS PRODUCE 200,000 ft. DAILY

SOUTHERN HARDWOOD LUMBER & VENEERS

Gummed Veneer Tapes

To the manufacturer of veneers as well as to the cabinet maker who makes any great use of them, gummed tape is one of the small but necessary adjuncts which often go far towards making or marring the craftsman's work in accordance with the reliance which can, or cannot, be placed upon them, says a writer in the "Cabinet Maker." Something of the care which must be exercised in the manufacture of gummed tape for use on veneers may be realized from the fact that the tape must in the first instance stick to the work "closer than a brother," and yet, when it is no longer required, peel off easily.

Before going further into the uses of veneer gummed tape, it may interest our readers to know something of the processes by which this article is made. The raw material is a stout brown paper, the term "tape" being applied to the finished product as well as to that in which cloth is the material used. The paper is bought in large rolls similar in size to those in which newsprint is delivered. The adhesive applied to the paper for veneer tape is glue, not gum, and experiments carried out over a long period have ensured that the glue used is mixed to exactly the right thickness in order to give the maximum amount of "stick."

The roll of paper to be gummed is taken from the storeroom and placed on the machine by which the adhesive is applied. The end of the paper is led between two rollers, one of rubber and one of steel, the former being always in contact with a bath of liquid glue. The machine is set in motion and the paper is drawn between the rollers, being coated evenly with the glue. From the machine the end of the paper is led straight into the drying-room, where it proceeds over a series of rollers, and finally emerges dry, and is rolled up again on another machine. Once the machine is started, the progress of the paper is continuous until the whole roll has been gummed, dried and wound up again on the second machine.

The gummed roll is next placed on another machine which unwinds the paper and passes it rapidly over a series of parallel knives, which cut it into strips, of the required width, the machine then rolling it up again. The roll of paper is now a series of coils placed one on top of the other. These are separated by hand, the ends are secured, a wooden peg is driven through the centre of each coil, and the gummed tape is ready for dispatch.

The idea of using gummed tape for joints is not only to hold them in position but also to render the joints airtight, in order to prevent shrinkage during the process of drying after the plys are glued and put together. After the boards are dry, and before the process of sanding or smoothing, the tape is taken off by wetting it. Consequently the paper used in the manufacture of veneer gummed tape must be very absorbent in order to allow its coming easily away from the wood, but at the same time strong enough to bear the strain of being pulled off in strips without breaking.

In the furniture factory where any quantity of veneered work is turned out gummed tape also plays an important part. When four separate pieces of veneer are to be used to make up a quartered panel, these are first matched up and may then be joined together by means of two pieces of gummed tape before being put into the veneer press. When the process of glueing is complete, the tape has to be removed, and it is essential that it should come away easily from the work when water is applied.

In addition to the plain paper tape, veneered tapes are made from cloth, also in perforated paper and cloth.

Demand for Standardized Millwork

The article and editoral in the September "Canadian Woodworkers" dealing with standardized millwork appears to have aroused considerable interest in this important question. One of the letters received, commenting on standardization of millwork, was from the Long-Bell Lumber Co., Kansas City, Mo., who says in part:

The bulk of mill work manufactured goes into the moderate priced home—the average home that is so much in demand now following the building shortage that came with the war.

The period just ahead will bring an enormous demand for these small houses, in fact, there are indications already in sections where house building is going on that the small home, carefully planned with considerable attention to economizing in space and cost wherever economy is possible, is becoming the popular type.

The orgy of extravagant buying seems to be about over, with every prospect that it will be naturally followed by a period of very careful buying. There is every indication that the demand for houses, which must come within a short time, will recognize this need for economy, without, however, sacrificing anything in the quality of building material used or in the "homey" touches that make a real home of a dwelling.

Already a distinct division between special millwork and standardized woodwork is being drawn. The builder of the moderate priced home is finding that standardized items may be had in many sizes and designs from stock, without the delays incident to having special designs milled. He is finding that it is more economical and more advantageous in many ways to plan in advance that openings and built-in-work space shall be of a size to fit standardized items, rather than to buy special work to fit the openings shown on a blue print. By purchasing standardized woodwork, he avoids delay and eliminates some of the cost necessary in having special sizes and designs made up. He obtains a reputable product from warehouse stock, and he does not sacrifice anything in the appearance of his home by taking advantage of this saving in time and money. The retail dealer, then, has these tremendous trade advantages in being able to offer standarized designs to his customers.

The Long-Bell Lumber Company has standardized all items of woodwork. As in all other Long-Bell products, this standardized woodwork is sold only through the dealer, who may select an entire bill of Long-Bell woodwork with the assurance to the customer that all items are carried in stock and may be shipped immediately.

Indications point to a sound popularity for standardized woodwork, a demand so far reaching that the average home builder will come to expect it from his dealer.

The kiln drying of lumber has been developed to a stage where green or partially seasoned stock may be dried at less cost and with a smaller percentage of loss than if the material were allowed to stand in the yards until thoroughly dry. That being the case, are you giving the drying end of the business the attention that it deserves?

One reason why our Gum is Straight and Flat

It *IS* Different

One of our customers to whom we recently made an initial shipment of our KRAETZER-CURED Sap Gum said to us:

"This is different from any Gum lumber I have ever seen."

Of course it is; that's exactly what we have been trying to make everybody understand. It's like another wood. **Better, vastly better.**

Most everybody thinks the Sap part of Gum must be black or discolored. **Let us show you differently.** Our Plain Sap and Quarter Sawn Unselected Gum is as **bright as a dollar,** with a slight pinkish cast, about the color of light cherry.

Of course, the inspection rules say "Stain is no defect," but **what do you say Mr. Manufacturer,** you who have to **cut up, work** and **finish** the lumber?

We do not see how the usual run of Sap Gum, discolored, black and lacking uniformity in color, can be used for the manufacture of furniture, trim, finish, etc. **It is NOT used by manufacturers acquainted with our kind.**

And warp—another unnecessary evil; the result of antiquated methods of production and handling. **Ours is straight and flat—EVERY BOARD OF IT.**

The initial cost is a little more, the final cost very much less and oh! the **satisfaction** resulting from **dependability** and **freedom** from **trouble** and **worry.**

Unscrupulous dealers misrepresent. Do not be deceived. **Insist on the genuine.** Every board bears our trade mark; it stands for the acme of quality and dependability in Hardwoods.

News of the Trade

The Dominion Furniture Co., Limited, Winnipeg, Manitoba, were recently incorporated.

The plant of the Canadian Reed & Rattan Co., Montreal, P.Q., has been destroyed by fire.

The Cedar Cove Sash & Door Co., Vancouver, B.C., are erecting a building to be used as a sash and door factory.

The partnership known as the Hamilton Furniture Repair Shop has been dissolved and the business will in future be conducted by L. B. Everitt.

The Fulton Motor Co., of Farmingdale, N.Y., who were negotiating for a plant and site at St. Catharines, Ont., have decided not to locate in that city.

The Progress Spring Bed Limited, Montreal, P.Q., are building an addition to their factory in the shape of a two-storey brick building 30 x 72, to cost $10,000.

Clarke Bros. Paper Mills, Limited, Glen Falls, N.B., have purchased what is known as the Ford factory, and intend converting it to the manufacture of boxes.

The Summerland Lumber Co. of Summerland, B.C., who now operate a mill and box factory at Mineola, B.C., contemplate installing a modern box factory at Summerland.

Cosmopolitan Gramaphone & Piano Co., Limited, Montreal, P.Q., have been authorized by supplementary letters patent to increase their capital from $10,000 to the sum of $100,000.

Maguire, Patterson & Palmer, Limited, Montreal, P.Q., are destroying a number of old buildings on a site at Pembroke, Ont., preparatory to the erection of a $5,000,000 match factory.

The name of Ditchburn Pleasure Boats, Limited, Port Carling, Ont., has been changed to Ditchburn Boats, Limited, and the capital stock of the company increased from $100,000 to $150,000.

J. I. Little, Fairbank, P. O., Ont., contemplates erecting a small chair factory on Dufferin St., Toronto. The building will be one-storey frame, 25 x 45, and is to cost in the neighborhood of $3,500.

The Woeller Boldue Co., Limited, Waterloo, Ont., manufacturers of upholstered furniture, are opening a warehouse in Vancouver, B.C. V. H. Wetmore will be in charge of the western business.

Plans have been drawn for an addition to the Hamilton Technical School. This new building will be used to house the auditorium, gymnasium, household science and woodworking department.

The factory of George White & Sons, London, Ont., has been acquired by the Stansell Motors, Limited. This will be used for temporary work until their new factory is completed next season.

The B. C. Spruce Mills, Wattsburg, B.C., who are constructing a large saw mill at that point, have commenced work on a planing mill. The equipment in this plant is to consist of five heavy machines.

The Stansel Motors, Limited, Amherstburg, Ont., have secured a site of 35 acres in London, Ont., and are planning to erect and equip a large automobile factory. It is not anticipated that work will be started before spring.

The Sterling Action & Piano Key Co., Toronto, acting for an English organization, have secured a factory site in New Toronto, 114 x 200 ft. It is anticipated that a factory will be erected to manufacture musical accessories.

Midland Woodworkers, Limited, of Midland, have opened an office at 129 Spadina Ave., Toronto, which is in charge of Frank A. Ransom, who will cover Toronto and Hamilton and the intervening towns in the interests of the firm.

Morency Freres, Limited, Montreal, P.Q., have been incorporated to manufacture furniture, cabinets and other wood products. Capital, $20,000. Two of the incorporators are L. A. Morency and A. Lacoste, both of Montreal.

The secretary of the Vancouver Board of Trade is in receipt of an inquiry for 500,000 boxes suitable for packing fruit. The inquiry states that the firms desiring these boxes are particularly anxious to place the business in Canada.

The North American Bent Chair Co., Limited, of Owen Sound, Ont., are bringing logs in, in large rafts known as "crib rafts." This is a very satisfactory way of handling logs, one that has not been in general use for many years.

Fairy Toys, Limited, Toronto, Ont., were recently incorporated to manufacture and deal in dolls and toys of every description Capital $40,000. B. Luxenburg and J. R. Huffman, barristers, both of Toronto, Ont., are two of the incorporators.

Work has been started on the new factory being erected at Cobourg, by the Rice Lake Canoe Co. of Gore's Landing. The building will be 160 x 52 ft. and will be rushed to completion so that manufacturing operations may be undertaken in the spring.

Macamic Nord, Limited, Macamic, Que., were recently incorporated to manufacture and deal in lumber, furniture, wooden vehicles and other wood products. Capital $20,000. O. Champagne and D. Duguay, both of Macamic, are two of the incorporators.

The Simonds Canada Saw Co., Limited, Montreal, P.Q., makers of saws, machine knives and files, are enlarging their plant by a one-storey addition, 175 x 70 ft. This will result in a material increase in output. The cost will be in the neighborhood of $50,000.

A. B. Beverley has purchased the three-storey factory situated at 485 King St. West, Toronto. Mr. Beverley has been manufacturing a line of phonographs in this building, and plans on making this the most up-to-date phonograph factory in the Dominion.

R. C. Patterson, Smithville, Ont., is in the market for a considerable quantity of woodworking machinery, including an 8-inch horizontal band resaw, 54-inch x 66-inch vertical band resaw, planers, edgers, 36-inch gang saw, steam engine, saw grinder and other machines.

The Woodworkers' Union of Owen Sound, Ont., held a very enjoyable At-Home recently in the C. O. F. Hall. The programme consisted of songs, instrumental numbers and sketches, and was followed by cards and dancing. W. Elliott was in charge of the gathering.

Ross and Millar, Limited, Hamilton, Ont., were recently granted a provincial charter of incorporation to manufacture and deal in boats, aeroplanes and other wooden vehicles. Capital $50,000. J. S. Ross and A. C. Millar, both of Hamilton, Ont., are two of the incorporators.

Dunwin Motors, Limited, Montreal, P.Q., have been granted a federal charter authorizing them to manufacture and deal in trucks, carriages and other wooden vehicles. Capital $100,000. A. G. Claxton and T. R. Ker, barristers, both of Montreal, are two of the incorporators.

See & Smith Motors, Limited, Toronto, Ont., have been incorporated to manufacture and deal in motor trucks, aeroplanes and other wooden conveyances. Capital $260,000. J. S. Beatty and J. R. Rumball, solicitors, both of Toronto, Ont., are two of the incorporators.

The Fowler's Limited, Cobourg, Ont., have completed their new furniture factory and are busily engaged installing the equipment and organizing the plant. Practically all the new machines in this new factory were secured from the Canada Machinery Corporation, of Galt, Ont.

Automotive Engineering Company, Limited, Montreal, P.Q., were recently incorporated to manufacture and deal in coaches, carriages, cabs and other wooden conveyances. Capital $500,000. Among the incorporators are L. P. Crepeau, K.C., and M. Dugas, advocate, both of Montreal.

The Transportation & Shipping Co., Limited, of Sorel, P.Q., recently launched a large four-masted schooner. The new vessel, which is known as the "Marion L," is a large craft of 1,500 tons dead weight. This is only one of the many large boats which has been built bp this firm.

The new plant of the Milverton Furniture Co., Limited, Milverton, Ont., is rapidly nearing completion. A large part of the equipment has been secured from the Canada Machinery Corporation of Galt, Ont. It is anticipated that this factory will be in full operation by the first of the year.

The Elmira Furniture Co., Elmira, Ont., have closed down for a few days to make certain repairs to the boiler-room equipment. There has been a certain amount of delay in securing the necessary material, but as soon as the repairs are effected, the plant will be operated to full capacity.

New Era Piano Co., Limited, Montreal, P.Q., were recently granted a provincial charter to manufacture and deal in pianos, organs, gramaphones and other musical instruments. Capital $45,000. H. Keene, accountant, and G. M. Lewis, barrister, both of Montreal, are two of the incorporators.

A small blaze occurred in the dry kiln of the Preston Furniture Co., Preston, Ont. A hole was cut in the roof

of the building and sufficient water poured in to extinguish the fire. Both the kiln and its contents were damaged, but as the blaze did not spread, the loss is a comparatively small one.

Best Boxes, Limited, Ottawa, Ont., were recently incorporated to acquire all interests of Boxes, Limited, Ottawa, Ont., and to manufacture and deal in all kinds of wood products. Capital $250,000. Two of the incorporators are J. P. Ebbs, barrister, and E. R. Jackson, accountant, both of Ottawa, Ont.

A by-law will shortly be submitted to the ratepayers of Listowel, Ont., with regard to the establishment of a plant for making steel, wire and wooden wheels for autos, trucks and bicycles. The name of the company has not been given out. B. L. Bamford of Listowel, is one of the interested parties.

Canada has lost the large order for 2,400 railway cars which the Belgian Government, through the Canadian Trade Commission, had been trying to place with Canadian manufacturers. The order has been given to German firms. Belgium will pay for these cars with the foodstuffs which hse will supply the Germans.

Canada Cabinette Heels, Limited, Montreal, Que., have been granted a provincial charter to take over the concern of Canada Cabinet Works, Limited, and to manufacture and deal in all kinds of wood products. Capital $250,000. Two of the incorporators are H. S. Ross, barrister, and H. M. Gardner, accountant, both of Westmount, P.Q.

Canadian Barrels & Kegs, Limited, Waterloo, Ont., have been incorporated to acquire the business of Charles Mueller Co., Limited, Waterloo, and to manufacture and deal in boxes, tubs, barrels and other wooden products. Capital $500,000. M. Aylesworth and H. J. Stewart, barristers, both of Toronto, are two of the incorporators.

A. Root, Greenbush, Ont., manufacturer of wooden measures and other wood products, is negotiating with a view to acquiring the sawmill in Smith's Falls, Ont., now operated by the United Farmers Co-operative Co. If Mr. Root succeeds in securing this plant, he will convert it to the manufacture of the same lines that he is producing at Greenbush.

Dominion Furniture Manufacturers, Limited, St. Therese, P.Q., were recently incorporated under federal charter as manufacturers and dealers of all kinds of wood products and to take over the business known as the Dominion Furniture Co. Capital $500,000. Two of the incorporators are L. McFarlane, K.C., and G. Barclay, both of Montreal, P.Q.

The McGill-Quinn Handcraft Products, Norwood, Ont., recently acquired a plant, and are manufacturing a line of woven fibre floor lamps. A complete line of woven fibre products is to be manufactured. The plant includes such machines as surfacer, bandsaw, mortiser, cut-off and ripsaw, etc. No further installations are contemplated at present.

The Westminster Furniture Manufacturing Co. of New Westminster, B.C., have commenced active operations and are producing a line of furniture made from B. C. hardwoods. The line manufactured is medium grade, being made chiefly of maple. The output at present is small, but additions and improvements are planned which will tend to enlarge this considerably.

The Canadian Edison Phonographs have been granted a provincial charter with headquarters in St. Thomas and a capital stock of $500,000, to manufacture, buy, sell and deal in phonographs and allied lines. Among the incorporators are Thomas Alva Edison, Chas. Edison, Stephen B. Mambert, Harry S. Miller and Wm. Maxwell, manufacturers, all of Orange, N.J.

A serious fire recently occurred in Arnprior when the plant and lumber sheds of the S. R. Rudd & Co. were destroyed. The stock in the sheds was being seasoned preparatory to being made into furniture, a line which the Rudd Co. intended taking up as soon as proper arrangements could be made. The loss, which is placed at $15,000, is partly covered by insurance.

At the annual meeting of Carriage Factories, Limited, Orillia, Ont., which was held in Toronto recently, it was intimated that the efforts of the company were being turned more and more to motor accessories, the plant at Orillia being devoted largely to the manufacture of automobile bodies. This leaves the Alexandria plant to take care of the carriage business.

Currie Manufacturing and Lumber Co., Brandon, Man., have been granted a provincial charter to take over the business formerly known as Currie Manufacturing Co. and to manufacture and deal in furniture, farm implements and other wood products. Capital $100,000. W. J. Currie and H. V. Currie, manufacturers, both of Brandon, Man., are among the incorporators.

At a recent meeting of the Clarkson Fruit Growers' Association a tender was received from a British Columbia firm, offering to deliver fruit baskets, boxes and crates at a price below the quotations asked by the Ontario manufacturers. The fruit growers of the Clarkson district will require 50,000 crates, 3,000,000 quart boxes, 175,000 11-quart baskets and 100,000 6-quart baskets to handle their 1921 crop.

N. O. Hipel, Preston, Ont., has commenced work on a two-storey factory building, which is to be fitted up with saw and planing mill equipment. The work on the building is proceeding nicely and it is expected that it will be finished in the near future. At present Mr. Hipel conducts a retail lumber yard, and when the new plant is complete he will be in a position to supply the trade with dressed lumber and finished building material of all kinds.

The Fisher Body Co. of Canada, are building a four-storey addition to their Walkerville plant. This will be completed about the first of the year. The new building is of heavy mill construction and will add about 75,000 square feet of floor space to their plant. It will be used for painting and trimming closed automobile bodies and will result in increasing the capacity of the closed body department about 80 per cent. The cost will be in the neighborhood of $275,000.

The fruit men in the different fruit-growing districts are alarmed over the quotation being made by the basket factories for baskets for next summer delivery. The prices quoted are from $130.00 to $140.00 per M for 11-quart baskets, as compared with from $85.00 to $94.00 for last year. The quotation on the 6-quart basket is $130.00 per M. The new prices mean that an 11-quart basket will cost 13c. or 14c. irrespective of its contents, which would have the effect of maintaining fruit and garden produce at its present levels.

The annual statement of Carriage Factories, Limited, Orillia, Ont., for the year ending July 31st, 1920, shows a deficit for the twelve months amounting to $36,845. Gross profits for the year were $302,635. Against this is charged administrative and selling expenses, $157,000; bond interest, $28,000; bank interest and charges, $51,000; bad debts reserved, $17,000, and reserved for inventory, $117,000, leaving a deficit as stated above. The total assets of the company are valued at $3,900,000.

National Steel Car Corporation, Hamilton, Ont., are operating to capacity and were recently forced to put on a night shift. The present output of the Hamilton plant is from 20 to 24 box cars per day. These are taken from the yard each day and hauled west to assist in moving the grain crop. This company has secured large orders from the Government Railway and also from the C. P. R. The Motor Car Department is very active and is turning out about three trucks per day.

An organization, name withheld, has been formed to manufacture automobiles and motor trucks in Winnipeg, Man. This car, which is to be known as the "Winnipeg," is expected to cost in the neighborhood of $1,800. The directorate of the company consists of F. A. Ogletree, president and manager; L. Arseneault, vice-president; D. E. Ogletree, secretary-treasurer; C. L. Law, superintendent, and W. H. McLean. A factory is to be established in Fort Rouge, Winnipeg. It is expected that this car will be placed on the market during 1921.

The W.F. Vilas Co., Limited, Cowansville, P.Q., manufacturers of furniture and school desks, are erecting a new addition to their plant. This new building, which will be of solid brick construction, will add about 10,000 square feet to the floor space. This addition will be used largely for the manufacture of high-class enamel ware, which will include enamel tops for kitchen cabinets and kitchen tables, and enamel stock for the manufacturers of refrigerators. It is expected that the new plant will be in full operation about the middle of April.

The Canadian automobile manufacturers met in Toronto recently and formed an association which is to be known as the "Automotive Industries of Canada." Mr. C. McLaughlin of Oshawa, president of the General Motors of Canada, Limited, was elected president of the new association, and W. T. Sampson, manager of the Gananoque Spring & Axle Co., vice-president. About fifty automotive companies have affiliated themselves with this association. Those present were optimistic, and, while admitting that sales had dropped, had every confidence in the future of the automobile industry. They declared that the outlook for 1921 was

LIMITED

705 Excelsior Life Bldg. - Toronto

very bright, and owing to the fact that the export trade would absorb a large proportion of the output of the Canadian plants, the coming year might witness another shortage of cars.

The Redden Woodworking Co., of Kentville, N.S., who were incorporated early in the year with a capital stock of $120,000, have purchased the mill formerly owned by the Nova Scotia Carriage Co., Limited, Kentville, and are now manufacturing lumber, building material, furniture and cabinet work. The company's lumber mills are located at Forrest Home, N.S., and the office and factory on Cornwallis St., Kentville. The president and managing-director of the company is A. P. Redden, C. R. Redden is vice-president, and P. M. Caldwell, secretary-treasurer.

The planing mill and sash door factory of the Whitby Brick & Clay Products Co. was totally destroyed by fire recently. The loss amounts to upwards of $25,000. The management has intimated that the plant will be rebuilt, but it is not definitely decided whether construction operations will be undertaken right away or held in abeyance until spring. The new plant will be constructed of hollow tile made by the company itself. If suitable arrangements can be made with the G. T. R., an unused portion of the roundhouse will be equipped as a temporary factory.

According to information furnished it is understood that the Dominion Shipbuilding Company, Toronto, which has been idle for the past few months, will start up again at the end of November. When the shipyards closed down the company had in hand two unfinished Government boats. In order to complete these and finish the contract the Government has requested the Henry Hope Company of Peterboro, Ont., to complete them. This they have consented to do, and will probably commence work about the end of November. It is hoped that further orders may be forthcoming and the plant be kept running throughout the winter.

The Rubber-Set Co., Limited, Toronto, Ont., are about ready to open their new brush handle factory at Gravenhurst, Ont. This plant, which was formerly known as the Aeroplane plant, has been completely remodelled to suit the requirements of the new owners. The electric drive has been installed and a dry kiln constructed at a cost of $10,000. This factory will be used exclusively for the manufacture of wooden brush handles. An initial output of 15,000 handles per day, valued at between $600 and $700, is expected. The output will be used by the factory in Toronto and the parent organization in the States. Employment is to be given to from 30 to 50 hands. Local wood will be used.

Personals

H. H. Hastings has been engaged to assist John E. Banks of Toronto, National Hardwood Lumber inspector, in the Toronto district.

William Robertson, of Victoria, former acting Lumber Commissioner for the East, but now of the Forest Branch of the Department of B. C. Lands, is spending a short time in Toronto and other cities on a visit.

Loren L. Brown, of Toronto, B.C., Lumber Commissioner, has been visiting several towns and cities in Western Ontario. The Department of Lands has provided him with a handsome new motor car for making calls.

H. W. Petrie, head of the well-known machinery firm of H. W. Petrie, Limited, recently made a donation to the Brantford General Hospital in the shape of the interest for five years on $25,000 worth of Victory Bonds.

Frank Purcell of the Frank Purcell Walnut Lumber Co., Kansas City, Kansas, sailed recently on the Aquitania for a tour of the European markets in the interests of the Walnut Export Sales Company. Enquiries from overseas are coming in freely and it was these signs of an active market that prompted the trip.

W. F. Beck of the C. Beck Mfg. Co., Limited, Penitanguishene, Ont., manufacturers of boxes and woodenware of different kinds, was recently married in Newmarket, Ont., to Miss Bernice Cane, daughter of J. E. Cane of the Wm. Cane & Sons Co., Limited, of Newmarket. Mr. and Mrs. Beck left on a trip to California, and upon their return will take up their residence at Penitanguishene.

Thomas Bradshaw, formerly finance commissioner of Toronto, has been appointed general manager of the Massey-Harris Co., Limited, Toronto, Ont., manufacturers of agricultural machinery. Mr. Bradshaw succeeds Mr. Thomas Findley, who for some years has held the dual office of president and general manager, and who recently resigned the latter position. Mr. Findley will continue to act as the company's chief executive.

Mrs. H. B. Smith of Owen Sound, recently officiated at the christening of the "Canadian Rover," which was launched at the Collingwood yards. Following the launching Mr. H. B. Smith, who is president of the Collingwood Shipbuilding Co. and interested in several furniture factories in Owen Sound, gave a banquet to the business men of Collingwood. About fifty citizens were in attendance. Mr. Smith referred briefly to the problems which confront the shipbuilding industry in Canada, and spoke in an optimistic strain regarding the future of the industry.

Obituary

J. H. Quirt of Toronto, Ont., recently passed away at Los Angeles, Cal. Mr. Quirt was associated with the A. R. Williams Machinery Co., Limited, of Toronto, for many years.

Neil McKinnon recently passed away at Singhampton, Ont. Mr. McKinnon conducted a carriage factory in that town for many years.

G. M. Webster, president of Webster & Sons, Limited, Montreal, P.Q., manufacturers and dealers in building material, recently passed away in that city.

Joseph Myers, Toronto, Ont., recently passed away in that city at the age of 97 years. Mr. Myers was a cooper by trade and for 38 years conducted a cooperage shop in Toronto.

Thomas McCann, Whitby, Ont., recently passed away. Mr. McCann was in his 80th year and was one of the oldest business men in Whitby, where he conducted a carriage factory for many years.

J. D. Collie, superintendent of the Office Furniture & Supplies Co., Limited, Brockville, Ont., recently passed away. Mr. Collie was instrumental in organizing the present plant when the Office Furniture Co. decided to move from Ottawa to Brockville.

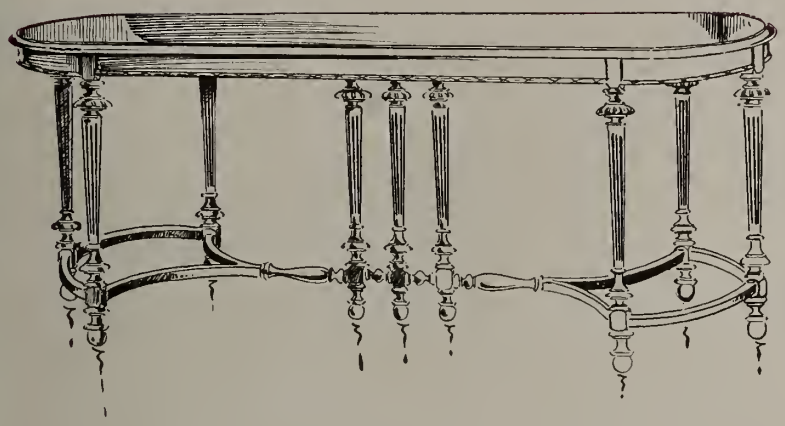
Thomas Long passed away recently in Toronto in his 85th year. He was a remarkable business man and identified with many interests. Mr. Long was one of the pioneers in opening up communication with Lake Superior ports and actively concerned in the development of inland navigation. He was the founder and president for a number of years of the Collingwood Shipbuilding Company, and was also identified with the lumbering interest a number of years ago.

Catalogues, Books, Etc.

An interesting illustrated booklet, entitled "Aluminium Applications," is being distributed by the British Aluminium Co., Limited, of London, England, through their Canadian branch at 265 Adelaide St. West, Toronto. It is surprising the number of industries which use aluminium in some form or other to advantage. Such a list will include the aircraft, automobile, furniture, woodworking, musical instrument, electrical, iron and rubber industries. In addition, there are a large number of general applications to which this valuable metal is peculiarly adapted. In the furniture industry it is used to a large extent for cauls in the veneer department and in sheet form for tops of tables, kitchen cabinets, etc. Copies of this interesting pamphlet may be secured on application.

The humidfying of woodworking plants or rather controlling and regulating of humidity in such factories is a subject that has received considerable attention of late years. It has been found that by drying the lumber to a certain percentage of moisture content and by controlling the humidity in the different departments through which the work passes, the product will come out with a certain definite percentage of moisture content, such as would make it most suitable for the climate of the country in which it is to be used. To those interested in this subject, catalogue No. 700 of the Buffalo Forge Co., Buffalo, N.Y., dealing with the fan system of heating, ventilating and humidifying, will be found to contain pertinent and valuable information. Copies may be had on application direct to the Buffalo Forge Co. or to the Canadian Blower & Forge Co. of Kitchener, Ont.

A new catalog has been received from the Paasche Air Brush Co., Chicago, Ill. This describes and illustrates the Paasche line of air spraying equipment and accessories. Air finishing is applicable to a wide range of work, including the finishing of furniture, pianos wicker furniture, auto bodies, mouldings, metal articles, in fact the application of this equipment seems to be practically unlimited. A copy of this new catalog, No. 13, will gladly be sent on request to the Paasche Air Brush Co.



For Your Finest Work

Hardwoods of Character

OAK, GUM POPLAR

IT is only stating a plain truth when we say that from our products have been made many of the finest examples of the woodworker's art.

These specimens coming from plants large and small in all parts of Canada and the United States speak well for a firm whose motto has always been "Quality & Service."

We base our appeal for your business on these two features and suggest that you send a trial order. We know we can please you.

Lumber Firm Inaugurates Technical Service

A new departure in the lumber business—a departmcnt for furnishing technical service free of charge to users and manufacturers of all kinds of lumber and other wood products—has recently been inaugurated by the J. W. Darling Lumber Company of Cincinnati, manufacturers and distributors of cypress, southern hardwoods, yellow pine and West Coast woods. The broad field in which this company operates places it in a position to furnish straight technical facts in its service work, unbiased by a desire to promote the use of any particular speeies or grade of lumber.

This service department will be called "Darling Technical Service." The work will be organized and handled by three wood speeialists of several years' experienee on the teehnical staff of the United States Forest Products Labatory at Madison, Wisconsin,—J. R. Watkins, Engineer in Forest Products, D. R. Brewster, Forester and Wood Teehnologist and A. C. Knauss, Engineer in Forest Products. Mr. Watkins has specialized on boxing and crating problems and the suitability of various woods for different purposes; Mr. Brewster is a speeialist in seasoning and kiln drying work, as well as in lumbering and lumber distribution; while Mr. Knauss has been engaged particularly on problems connected with atmospheric eonditioning, built up eonstruction and glues. Additional men of special training in the uses of wood will be added to the organization as the expansion of the work may require.

Your Trade Paper

The trade paper is probably the most alive to the exigencies of edueation, and the gratification of the mental needs of its readers, than any other press production, says an unknown writer.

It asks, absorbs, gives.

Take up a trade paper; note the quality and texture of the paper, the clearness of the type, the numerous illustrations, the beauty of its arrangement, the logic of its arguments, the well-expressed opinion of its contributors.

Then tell us if it isn't an education—beautiful, inspiring, strengthening.

Thousands of trade paper subseribers are receiving mental uplift and courage.

More or Less

A little more deed and a little less creed;
A little more giving and a little less greed;
A little more bearing other people's load;
A little more God-speed on the dusty road;
A little more roses and a little less thorns,
A sweeter air for the sick and forlorned;
A little more song and a little less glum;
A little gold for the uplift of the slum;
A little less kicks for the man that is down,
A little more smiles and a little less frown;
A little more love for the man in our trade,
A little more sunshine and a little less shade;
A little more done for father and mother,
A good word, a strong arm for a U.C.T. brother;
A little less knocking and a little more cheer,
A good word for the hero that's left in the rear;
A little more love and a little less hate,
A little more kindness at your brother's gate;
A little more helping by you and me,
A little less frowning where all can see;
A little more flowers in the pathway of life,
A little less sadness at the end of the strife.

FOR SALE

Used Woodworking Machinery

We warrant every machine in the following list to be in good working condition, some have been re-built and tested, others, operating recently satisfactorily in mills of our best customers.

SUBJECT TO PRIOR SALE

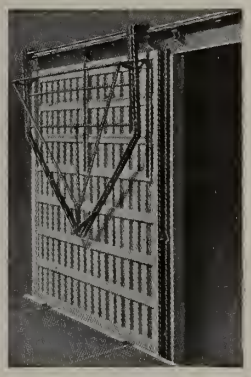
TORONTO, CANADA

The Door Carrier System



Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

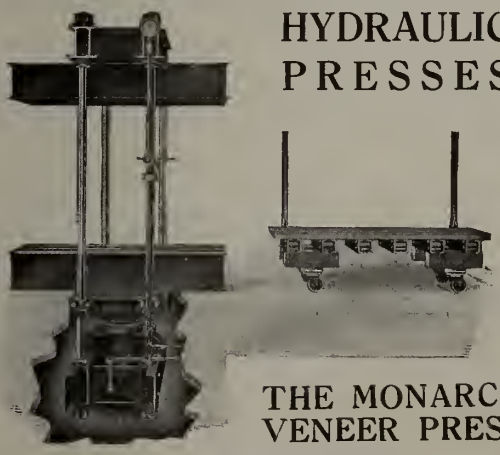
INDIANAPOLIS, IND.

FARQUHAR

HYDRAULIC PRESSES



THE MONARCH VENEER PRESS

CONSIDER THESE FEATURES:

- Heavy Steel Strain Rods.
- Steel Cylinder and Detachable Saddle.
- Cylinder Repackable without removing Ram.
- Double Steel Head and Base.
- Quick - acting Pump, Rigid Construction.
- Operating Valve at Press.
- Improved Retainers.

Our HYDRAULIC VENEER PRESSES are built to suit all requirements. All proportions are very liberal, while material and workmanship are the best throughout.

Pressure of 100-lbs. to the square inch is applied to the veneering surface. Stock is handled by the renowned retainer system, unsurpassed for both efficiency and economy.

With our process, but five minutes intervene from the time the car enters the press until the stock is released and the press is ready for the next load.

Catalogue, giving full particulars as to sizes and specifications, free on request. We also manufacture all kinds of special Hydraulic Presses to order. Write us concerning your requirements.

A. B. FARQUHAR CO., LTD., Box 171, YORK, PA.

Woodworking Equipment

Here is a list of new and used machinery. Just look it over and drop us a line.

Our prices will interest you.

1—Lockman Multiple Carver.
1—Waymouth Lathe.
1—Cowan Dowel Machine.
1—S.A. Woods Matcher.
1—12" Cowan Moulder.
1—35" Double Disc Sander, American.
8—Belt Sanders.
2—Jig Saws.
1—Power Feed Rip Saw.
1—34" Band Saw.
1—Jackson-Cochrane Band Rip Saw.
1—Linderman Glue Jointer.
2—Three Drum Sanders.
1—C.M.C. Double Surfacer.
1—Mortising Machine.
Buzz Planers, Woodworkers, Veneer Presses, Scrapers, Fans, Belting, Hangers, Pulleys, Shafting, etc.

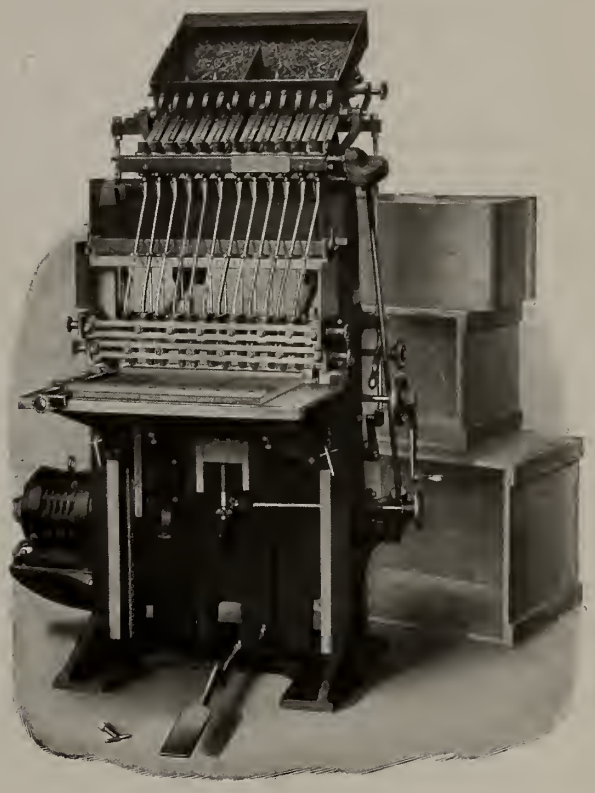
How do YOU Drive Nails?

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



Morgan Machine Co.

You Can Use This to Advantage

The Olson Frame Extension

Increase the carrying capacity and therefore the usefullness of your Ford Truck by the addition of the Olson Frame Extension.

Particularly adaptable for the transportation of lumber and furniture for either short or long distances.

The perfect balance of the Olson makes smooth and easy running—a desirable feature when easily broken articles are being carried.

Our nearest branch will be pleased to send you fullest information.

Rub Your Varnish Electrically

with a

MATTISON ELECTRIC Rubbing Machine

—operates direct from a lamp socket

By doing the work of two hand rubbers, the Mattison Electric cuts wages 50%, thus paying for itself many times over every year. It is a power unit complete in itself, consumes very little current, and requires no special hose or piping.

Any flat varnished surface, larger than the machine itself can be rubbed to better advantage with this portable electric rubber than by any other method.

The machine is very easy to handle, and relieves the operator of all the hard labor of hand rubbing. His attention is concentrated on his work; and with the machine he produces a finish much more uniform than is possible by hand.

Ask for bulletin "165" and get detailed information

Mr. Box Manufacturer,
Everywhere,
Canada.

November, 1920

Subject: Nailless Strapping

Dear Sir:—

To show how to get the business you would otherwise lose is the object of this **open letter.**

Shippers everywhere are seeking a satisfactory means of reducing the cost of their shipping containers. The meeting of this demand requires serious consideration and intelligent foresight on the part of box manufacturers.

The solution lies in advocating the use of lighter shooks in connection with nailless strapping, which scientific tests have shown results in a stronger, lighter and cheaper box and one that is sealed against pilferage.

Rather than have your prospective customers substitute some other type of container for wooden boxes, your good judgment will suggest that you test our claim that the Sig'node System is the answer to the problem. Elsewhere in this issue of The Canadian Woodworker interesting comparative tests are shown which bear out our contention.

Representatives at Toronto and Montreal will gladly demonstrate the method of operation of our system and advise as to size and cost of strapping best adapted for use on various boxes.

Strapping your shooks and veneers The Sig'node Way solves another shipping problem.

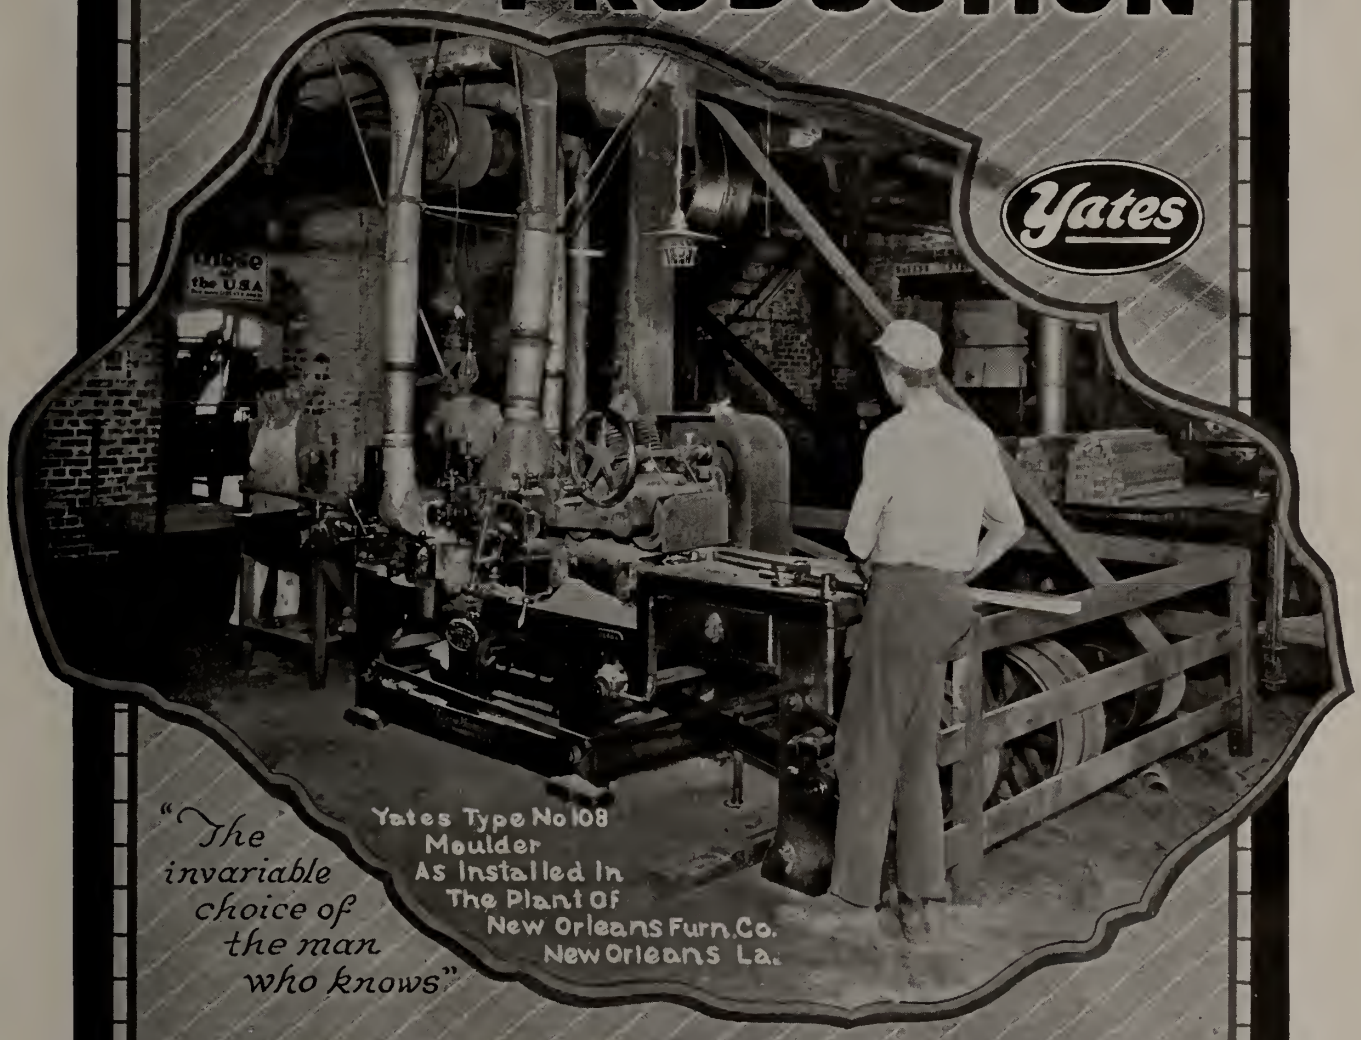
Get in touch with our Canadian representatives. It will pay you to do so.

Faithfully yours,

SIG'NODE SYSTEM, INC.,

Toronto, 46 Colborne St. Montreal, 20 St. Nicholas St.

LESS MEN, MORE PRODUCTION



Yates
"The invariable choice of the man who knows"
Yates Type No 108 Moulder As Installed In The Plant Of New Orleans Furn. Co. New Orleans La.

The Yates No. 108 Moulder

is built for strength and speed and it sure does get the work out. Is just the machine progressive mill men are looking for. They cannot afford to be without a No. 108. This is the big reason. By actual tests, in many mills, under all conditions, the Yates No. 108 got out more mouldings and better mouldings with less men. Write a letter for detailed information and circulars.

Convert a Loss Into Profit

Save 40 to 60 per cent. on Production Costs by using a

No. 429 "Lightning" Glue Jointer and Edge Molder

Your narrow stuff now going to waste in your mill or factory can be jointed at a low cost—is really stronger than solid pieces—and you convert a loss into a handsome profit.

This machine is the greatest time and lumber saver presented to the woodworking industry in years

J. A. Fay & Egan Co.

Established 1830

World's Oldest and Largest Manufacturers of Woodworking Machinery

W. Front St. - Cincinnati, Ohio

The "Shimer Limited" Expansion Head

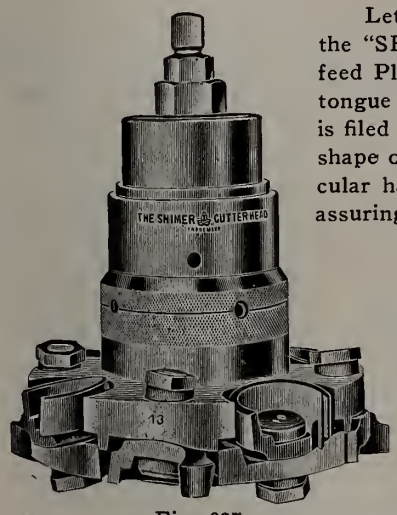

Fig. 627

Let us draw your attention to the advantages of using the "SHIMER CUTTER HEAD" for general Mill and fast feed Planer work. The Cutter is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The bit being circular has from 3½ in. to 5 in. cutting length to the cutter, assuring long wearing life to the cutters

Note that the cutter, being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without the Self-Centering Sleeve, and made Expansion or Solid, to suit the customer's wishes.

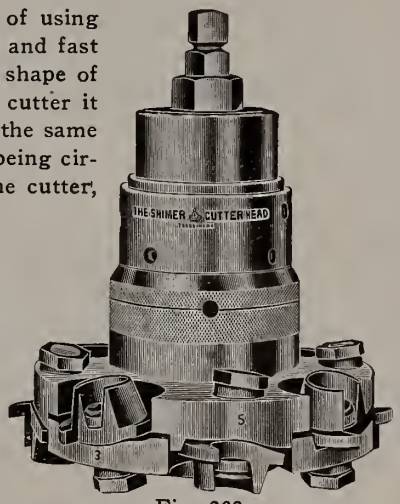

Fig. 268

Shimer Heads have been in use for sixty years, and their reliability and reputation have spoken for them in the past. Let us know your wants and we will guarantee their reliability at the present.

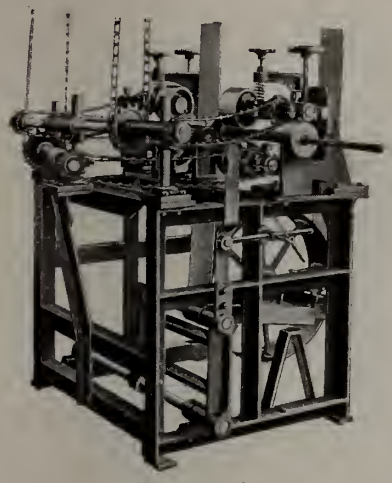
BEATS THEM ALL!

An Automatic Machine for Sanding Handles Smooth as Glass
in the Twinkling of an Eye



No. 75 Rapid Sander

The Rapid Automatic
Sanding and Buffing Machine

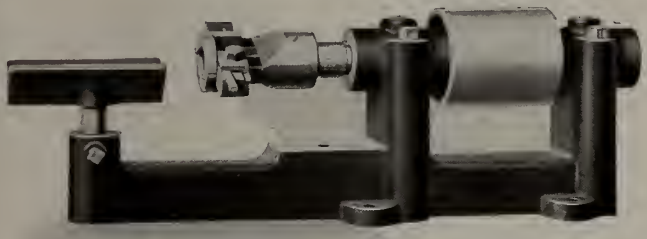
Quality: It will make your handles as smooth as the highest grade furniture, their beautiful finish aiding greatly in their ready sale at top-notch prices.

Speed: It sands turned stock at the rate of 70 lineal feet a minute, which lowers the cost per handle to next to nothing.

Method: The operation is automatic throughout. Large flat feed rolls, 6-in. diam. by 3-in. face, revolve the stock with such great rapidity against a single belt of fine sand cloth that it is all done with astonishing swiftness.

Capacity: Takes stock from 20 inches up to any length and ¼-in. to 1¾-in. diameter.

A machine to make your handle business pay
Will you not write for complete information?

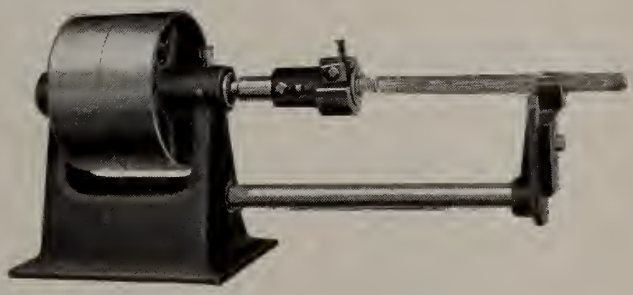


No. 31 Topping and Sizing Machine

For Topping all kinds of Handles & Chair Stock.

Will cut Tenons Straight or Tapering for all purposes.

Ask for full information.



No. 20 Automatic Threading and Tapping Machine

It will tap and thread all kinds of Wood-work such as Brush Blocks, Mop Handles, Sweeper, Duster, and all similar Handles, at the rate of from 20 to 30 pieces per minute. This work is done on all kinds of wood and a clean, perfect thread is always guaranteed.

Chucks and Taps made to order for any and all kinds of threads, from ¼-in. to 2-in. diameter, and any number of threads to the inch.

This machine is in use all over the world, giving perfect satisfaction in each and every instance.

Free samples of work and full information upon request. Write today.

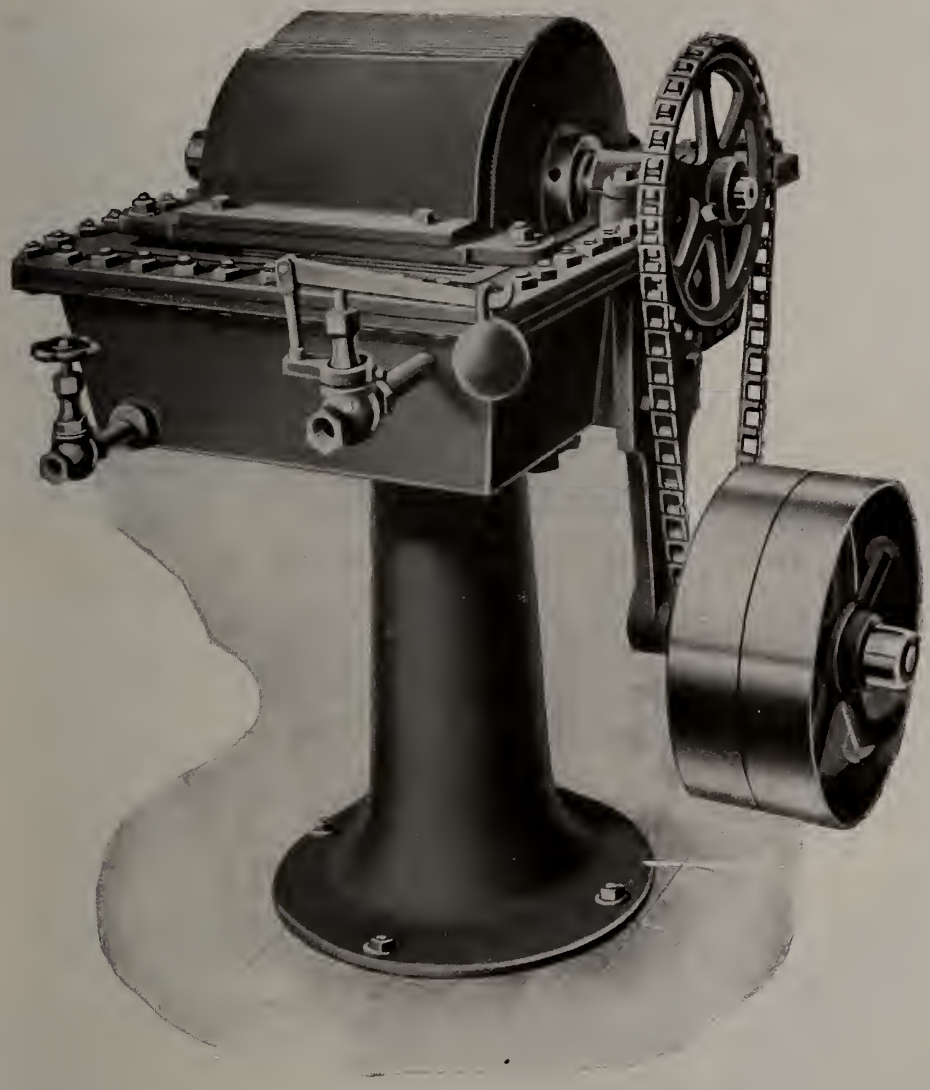
No. 192 Roll Glue Spreader



Designed for Glueing Edge Stock and Narrow Widths

The frame is a large pedestal casting with cored centre. The glue pot in which the drum is suspended, is a heavy cast iron pot, lined with sheet copper. It is tightly fitted and covers the steam or hot water retort, which is that part of the frame shown above the column. The steam or hot water retort is fitted with proper steam connections, and both the glue pot and retort are fitted with practical drain cocks. The space between these two receptacles is large enough to allow sufficient circulation of steam or hot water around the sides and bottom of the pot.

The drum or glue roll is of cast iron, with small corrugations for holding the glue.

Weight, 500 lbs.; size of glue roll—length, 12", width, 10"; fitted with tight and loose pulleys.

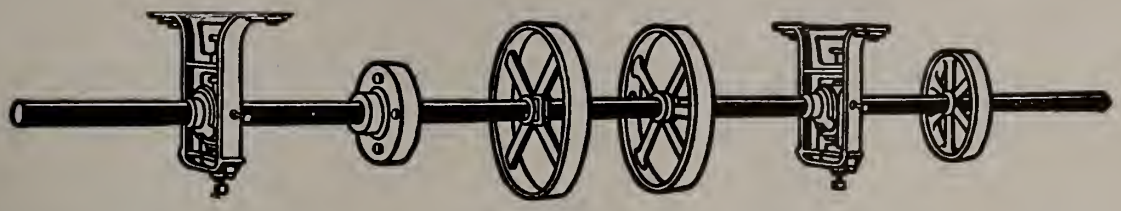
AGENTS FOR L. & I. J. WHITE CO., MACHINE KNIVES



If Shafting Always Remained in Perfect Alignment!

—then hangers equipped with ordinary non-adjustable bearings would come much nearer fulfilling the purpose for which they were designed.

But the facts are that practically all line shafting runs very badly out of alignment and causes non-adjustable bearings to bind the shaft. The result is excessive friction that cuts down production, wastes fuel and eats into your dividends.

But this large loss—amounting in many cases to 25 per cent. of all the power produced or bought—can be largely eliminated by the installation of S K F BALL BEARING HANGERS.

For with S K F Ball Bearing Hangers the shaft rides almost frictionless, not only when well aligned but also under extreme conditions of misalignment. The inner race tilts with the shaft—the bearing can never bind.

Other most important features of the S K F Hangers are **longer life, lower maintenance cost,** and a material saving in lubrication.

A Better Band Saw and The Reasons Why

The illustration shows the Oliver No. 16 Band Saw—with Safety Guard.

One of the principal functions of the Oliver is to save lumber.

It also saves time—and labor.

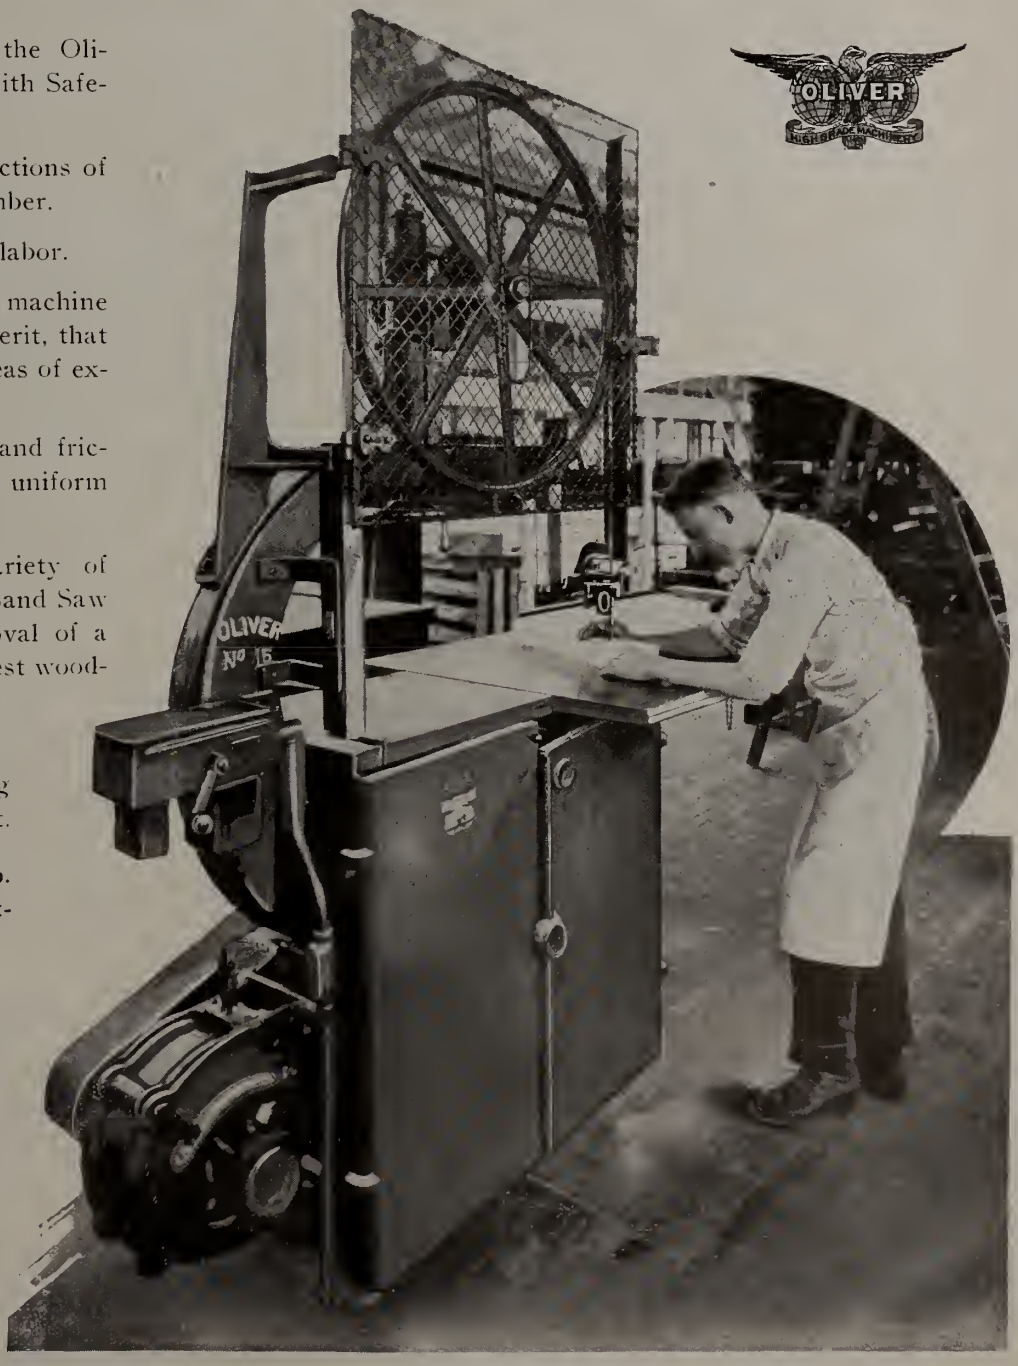
This is a general utility machine of more than ordinary merit, that embodies all the good ideas of expert designers.

The bearings are large and frictionless, insuring steady, uniform sawing.

Adapted to a wide variety of work the Oliver No. 16 Band Saw has met with the approval of a great number of the largest woodworking concerns in the country.

Let it show it's working qualities in **Your** plant.

Send for Catalogue No. 16 on Oliver Woodworking Machinery.



Oliver
MACHINERY COMPANY
GRAND RAPIDS,

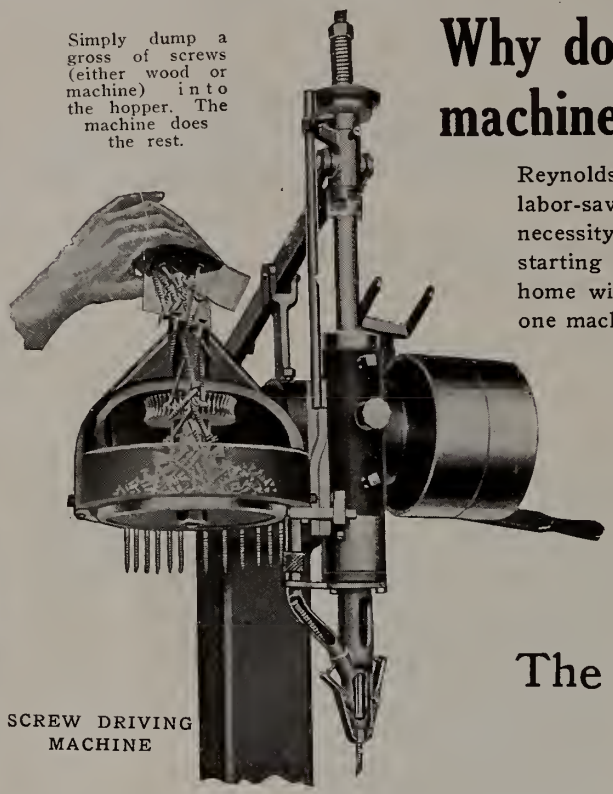
Simply dump a gross of screws (either wood or machine) into the hopper. The machine does the rest.



SCREW DRIVING MACHINE

Why do by hand, what a machine does better and quicker?

Reynolds Screw Driving Machines are inexpensive, labor-saving, money-making devices, which eliminate the necessity of handling each screw separately, many times starting them with a hammer before they can be driven home with a Screw Driver. One ordinary operator with one machine will frequently do as much work in the same length of time as five or six men with other methods. Ordinarily a boy or girl operator can set from 800 to 1200 screws per hour. On some classes of work with an expert operator, a record of 2000 screws per hour has been made.

Send us dimensions over all of your work and gauge length of screws used and we will send you complete description of the machine to meet your requirements.

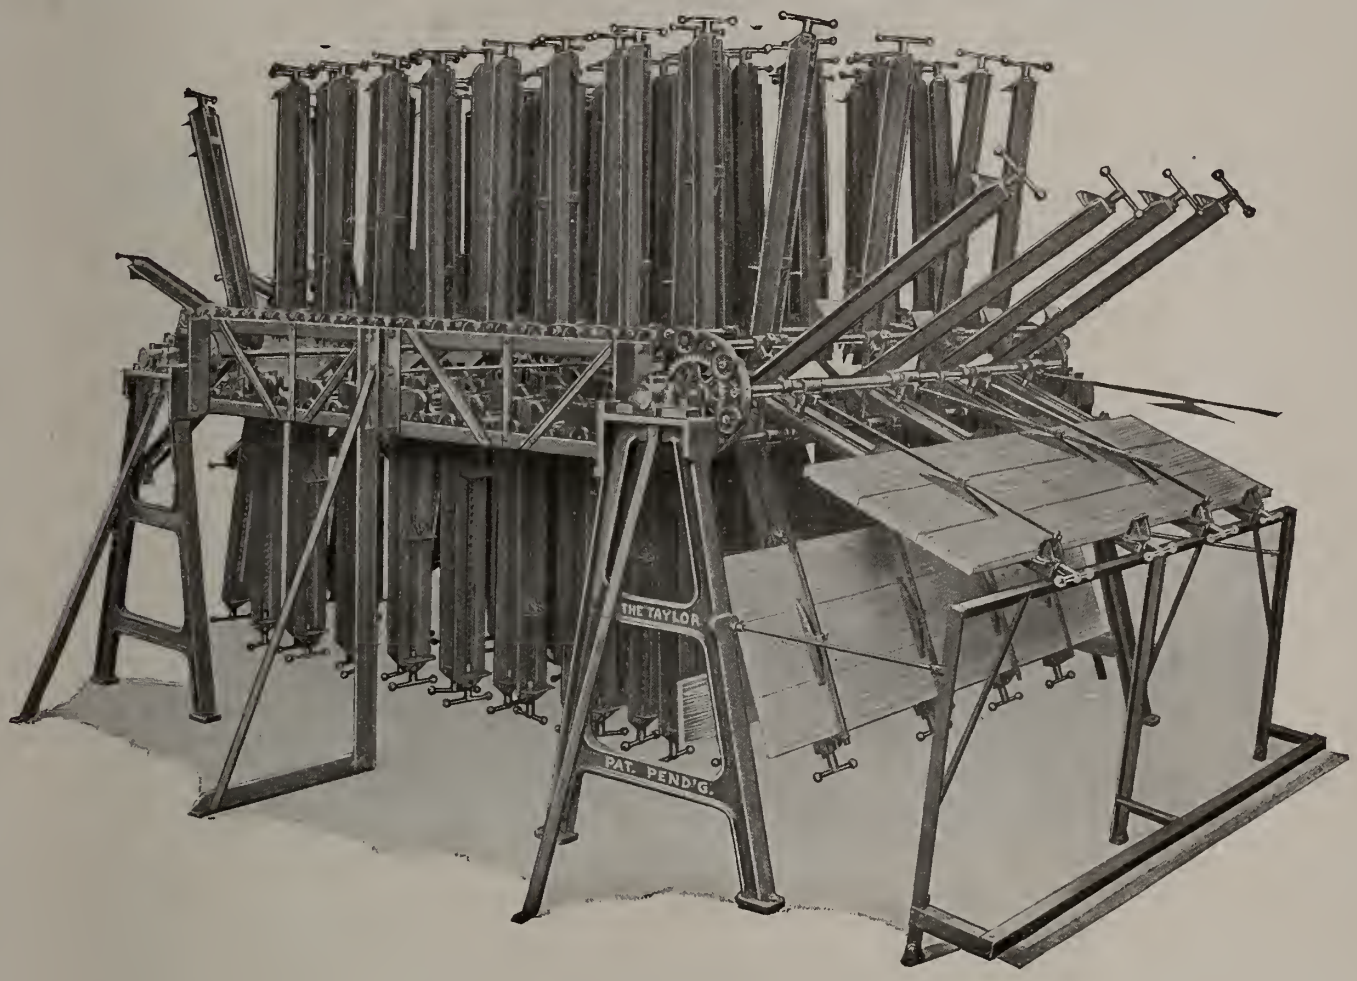
CLAMP The Taylor CARRIER

REG. U.S. PAT. OFF. TRADE MARK



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

Goodyear Klingtite Belts driving the sugar cane crushers of Cuba, Mexico and Central America

Canadian Success Promotes World-Wide Sale

As a result of the way Goodyear builds and sells belting and industrial hose in Canada, you will find these Goodyear products saving and serving in over 1,000 of Canada's finest industrial plants and mines.

The analysis of conditions, the scientific specification and application of belts, which Goodyear men make in Canadian plants they are now making all over the world.

To meet the requirements of world-wide trade it has been necessary to make some changes in the names of Goodyear Belts.

For example, Goodyear Extra Power is now Goodyear Klingtite Belt.

But the change is a change in name only.

This world-wide use of Goodyear Belting and Industrial Hose, Canadian-made, will multiply many times the fund of data and experience available to Canadian Goodyear users.

The problems overcome and the lessons learned in the factories of Japan and China, in the mills of India, in the workshops of South America, in the mines of South Africa, by the industries of every country, can now be applied by Goodyear men to Canadian industrials.

When the Goodyear belting man comes to talk to you, this information guides him in advising with you. His help is valuable —and costs you nothing. Phone, wire or write nearest branch.

The Goodyear Tire & Rubber Co. of Canada, Limited

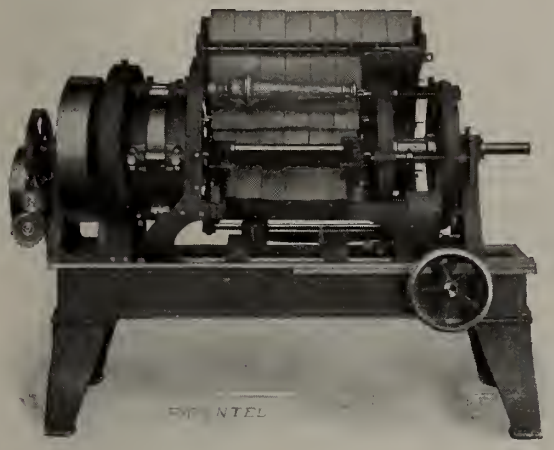
Branches: Halifax, St. John, Quebec, Montreal, Ottawa, Toronto. Hamilton, London, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver. Service stocks in smaller cities.

GOODYEAR BELTS

MADE IN CANADA

KLINGTITE GLIDE BLUE-STREAK

JUST A MINUTE

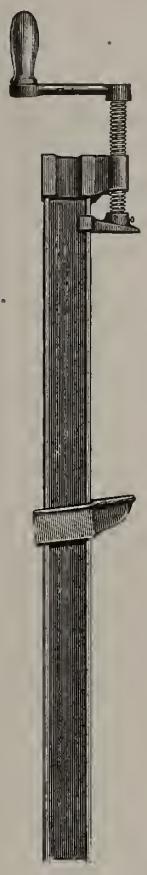


Saved may not amount to much, but a machine that can save $2,000 to $3,000 a year is well worth investigating.

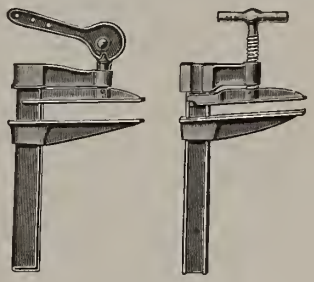
The Nash Sander for furniture turnings has done just that for many a furniture manufacturer.

Why not for you?

J. M. NASH, Milwaukee, Wis.



Colt's Clamps
for the
Woodworker



Colt's Universal and Vise Clamps are unsurpassed for the Furniture Manufacturer and General Woodworker. They are made right, both in design and quality of materials and workmanship.

Colt's Clamps are quick-acting and have broad jaw clamping surface.

For further information write for Catalogue No. 294.

Batavia Clamp Co.

235 Centre St. BATAVIA, N. Y.

The Elliot Bull Dog Planer

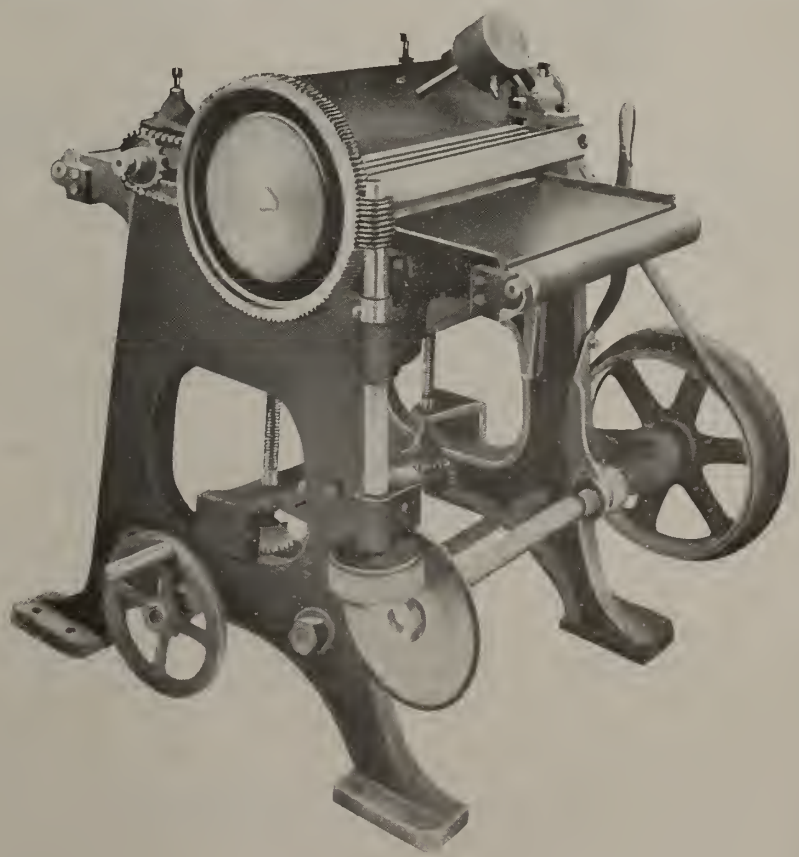
The illustration shows our new 16" x 6" Planer.

This Planer will fill a long felt want for a machine that will run from a 1½ or 2 H.P. Motor. It can be run from the Motor on an ELLIOT WOODWORKER, or from any other power by the addition of a counter-shaft.

We have eliminated all cut gears with which all other Planers are equipped, and drive the feed rollers with a worm gear thereby saving power.

This machine will do fine work and will soon pay for installation.

Write for prices and terms.



ELLIOT MACHINERY

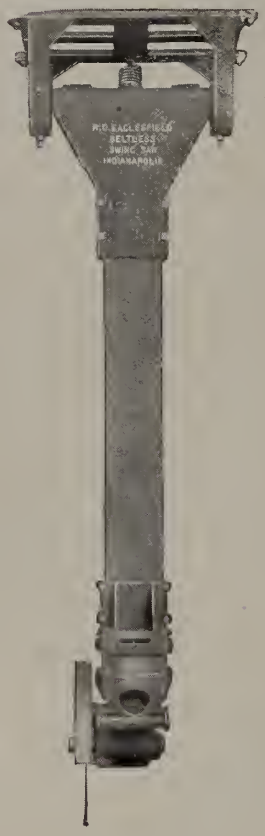
BELLEVILLE · ONTARIO

EAGLESFIELD

"Beltless" Swing Saw



Adaptable to close, accurate work

The "Eaglesfield" is the result of very careful study of swing saw requirements, and is designed with a special view to economy, reliability of operation and compactness.

This saw is operated by a specially designed and rated four-horsepower motor, the transmission being direct to the saw mandrel through a set of bevel gears, both saw mandrel and motor shaft being supported in S.K.F. ball bearings.

The hanger is of unified construction to insure rigid support and eliminate vibration. A rocker coil spring is provided instead of the ordinary counter balance weight.

The motor which is mounted in, and forms part of the head, is supplied in 60 cycles, either 2 or 3 phase, and any standard voltage. Speed of motor is 3,600 R.P.M.

One circular saw, which will cut five-inch stock, is included with each machine.

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the manpower, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and make mechanically perfect. They produce smooth lumber and cut down your operating expense.

Write for catalog and prices.

Eleven Flooring Units

Annual Capacity, 130,000,000 Feet

We manufacture our lumber for the mutual benefit of ourselves and those who purchase it from us.

We desire to see all of our customers prosperous. This is neither exclusive selfishness, nor unadulterated altruism. It arises from our belief that in the course of proper dealings between buyer and seller, neither is enriched at the expense of the other, nor is one necessarily impoverished if the other is enriched.

Our belief is that our dealings should result equally to the benefit and profit of our customers and ourselves, at the same time.

We make this thought vital in our business, by inculcating into our Sales Department, and into the mind of every salesman, a thorough comprehension of our policy, founded on the Principle of Service. We say to them:

Co-operation not competition finds its place in this policy. Do not deal with our patrons in the spirit of competition, for this leads you to seek to get the most for the least. Serve them in a spirit of co-operation, by seeking to ascertain their needs, and then endeavor to render the most perfect, satisfying service possible in filling the need.

We believe that in final analysis we prosper, only as those we serve prosper.

Our interest and that of our patrons are so similar and so intimately united and inter-related that nothing can be ultimately helpful to us which is not also beneficial to them.

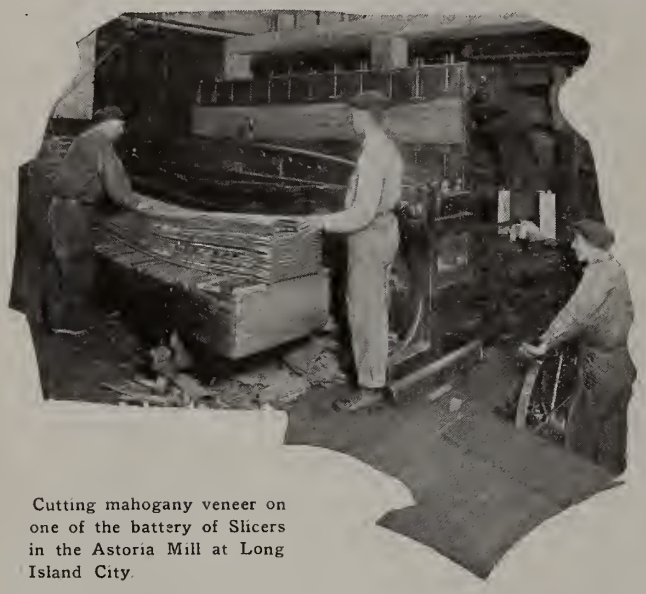
UTLEY-HOLLOWAY COMPANY

General Office: 1226 Conway Bldg., CHICAGO, ILL. **Band Mill: Clayton, La.**

ASTORIA MAHOGANY
LUMBER & VENEERS



Cutting mahogany veneer on one of the battery of Slicers in the Astoria Mill at Long Island City.

Slicing Twenty-eight to the Inch!

THE choice, figured mahogany logs, which our experts select for fine veneer making, are cut by huge diagonally operating knives or "slicing" machines. With these slicers a remarkable degree of uniformity in cut is obtained—an Astoria feature which has long been appreciated by manufacturers of high class furniture. This uniformity of cut is but another element in the service which over a quarter century has made us the largest complete mahogany lumber and veneer organization in the United States.

Astoria Mahogany Co., Inc.

EDWARD CLARK & SONS LIMITED

807-9 BANK OF HAMILTON BUILDING - TORONTO, Ontario

American Black Walnut

Enjoys World Wide Appreciation

In spite of most unfavorable rates of exchange, excessive ocean freight tariffs, and limited financial resources Europe wants America Walnut and is now buying. Europeans know walnut is the finest cabinet wood grown, and rightly refuse to consider substitutes.

Virtues of Walnut should be fully recognized on this continent as every phase of the cabinet wood situation today points out the advantage of featuring American Walnut.

All American Walnut is good but Iowa really affords the best.

We are prepared to supply you with
Walnut Lumber and Veneer

Des Moines Sawmill Company

Des Moines, Iowa

"Hartzell's Choice Walnut"

The way Walnut comes to us

COMING AND GOING

One constant stream of American Black Walnut from "Stump to Consumer" flowing through a steady, reliable and satisfactory channel.

"Geo. W. Hartzell"

Logs in the rough coming in Veneers and Lumber of the highest quality going out daily year in and year out covering a period of 35 years.

We rightfully claim your patronage because of "SERVICE and QUALITY," if there is any question in your mind about it

"Try Us and We Will Ship You the Convincer"

No Order too large, no Order too small to receive the close and careful attention it is our custom to give. That is a great part of our business, serving our customers.

"WRITE FOR SAMPLES AND QUOTATIONS"

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

©AWMA

"The Cabinet-wood Superlative"

No "Jimmies" Needed

In *W*alnut furniture, no matter how old or how new, the drawers slide smoothly and the doors open and close without jamming. If the workmanship is good, give the cabinet-maker the credit. He in turn gives *W*alnut most of the credit—because often he has done just as careful work in other woods and then has been blamed, perhaps, because the moving parts "stuck." So *he likes Walnut.* ("It gives his skill a real chanst.")

The supreme beauty of *W*alnut, in addition to the above qualities (and plus its "workability" and its "carvability"), accounts for the world-old supremacy of *W*alnut as a cabinet-wood—and its price permits its use in *every grade* of furniture that the careful buyer is likely to ever consider.

It will help you in your furniture buying to *know all about* American Walnut. (The furniture man will respect your discrimination. He knows the facts—and is glad that you do.)

Don't fail to WRITE NOW for the WALNUT BOOK —edition de luxe—which will come by return mail with our compliments—and our confidence in your appreciation of its value.

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION
1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Frank Purcell
Walnut Lumber Co.

Plenty of logs like the portion of our stock shown above have made possible the million and a half foot stock of well manufactured American Walnut Lumber which we now have to offer.

"Gorham Quality"

built up stock

THE pride of attainment follows each piece of stock which leaves our hands, because we know that Gorham Quality serves the furniture manufacturers in an exceptional manner. Our built-up stock is the result of three generations' constant, diligent study of the problem of producing highest quality panels, desk beds and tops that will not warp, check, blister or loosen.

Gorham products will not fail you.

Vol. 20 Toronto, December, 1920 No. 12

Are You Doing Your Part?

It is admitted on all sides that newspaper propaganda, heralding a return to pre-war levels and exaggerating every downward price movement, is largely responsible for the stagnation from which both industrial and business life is suffering, but that is as far as the average persons seems willing to go. If the present conditions art largely psychological, fostered by scare headlines and senseless chatter, what are you doing to counteract it, to induce the public to take a sensible view of the situation?

Resting on the oars of business and calmly awaiting results will not help any, neither will wondering what the future has in store. If one and all were to adopt an optimistic attitude, have faith in the future, talk good business, increasing sales and demand, and aggressively go after more business because of a faith in the future, it would not be long before a marked improvement would be noticeable. On the other hand, every time anyone expresses a doubt about the future, about conditions improving after the first of the new year or in the early spring, it adds weight to negative side and retards the approaching development and expansion.

The price recessions which have taken place in many lines do not indicate a healthful decline in values but rather were forced through a lessened demand, in realty a buying strike. When the volume of trade increases and conditions and values are more or less stabilized, it is doubtful if the frenzied demand and soaring prices of the past year will prevail. Instead sane competition, coupled with greater efficiency and increased production, will rule. It is likely that coming years will see a level of values lower than those which prevailed during 1920, but such decreases as do occur will be due more to increased production brought about by greater efficiency on the part of our workmen and our industrial organizations than to artificial conditions and deflation of prices.

That being the case, is the present not an opportune time for the manufacturer to analyze his plant and his methods, probe into the innermost details of his organization and relentlessly search out and remedy all weak spots. If keener competition is to rule, the manufacturer who is thus prepared to meet it, who is able to reduce his costs through efficient methods, new equipment or improved organization, will profit most. If slackened demand has resulted in decreased output or part-time idleness, every spare minute should be employed in putting the plant and its organization on a basis which will enable it to compete under coming conditions. There is no doubt about the future so why not act accordingly.

In the woodworking field at the present moment the building industry seems to be the key to the situation. This should not be taken to mean that if building does not revive conditions will remain quiet, but rather that as building increases, the whole industry will prosper. Housing conditions are bad, new houses and buildings are required by the thousands and hundreds of thousands. Experts say that some of this connot be put off any longer, a part of it must be gone ahead with next spring and summer. This seems reasonable. Building materials have in many instances receded from the high peak of the early summer. It is anticipated that money will be more plentiful and available in larger quantities. In all likelihood labor will be more efficient. Why then should building be delayed?

In spite of all some may think and say, the law of compensation still rules. The inevitable reaction from the present depression is bound to occur. It always has and always will. This is only a passing phase, one that will soon be forgotten. Business will pick up; orders will come.

We extend the season's greetings and wish you and those whose happiness is yours a full measure of Christmas joy and success for the New Year

Figure 1. View in cabinet-making department, showing tables for House of Commons, Ottawa, being assembled.

Reproduction of Old Models and Antiques

A Visit to Henry Morgan & Company, Limited, Montreal—Mahogany Desks for Bank of Montreal—Work Underway for Parliament Buildings, Ottawa

Good furniture, well designed and well made, is being more eagerly sought after by the discriminating home furnisher. This increasing demand for fine furniture is very gratifying, indicating, as it does, a growing appreciation of that which is beautiful and appropriate in home furnishings.

To satisfy this newly-aroused artistic sense, the designers of furniture have been forced to fall back on the old masters of furniture design—men who were seemingly born with an eye for pleasing proportion, attractive lines and fine detail—and reproduce and adapt the beautiful old period styles.

The accurate reproduction of antique and period designs, together with the remodelling and restoring of many fine old pieces, is one of the more interesting phases of the work of Henry Morgan & Co., Limited, cabinet makers, Montreal, P. Q. A walk through the cabinet-making department of this plant, reveals such transformations as the conversion of an old spinet piano into an attractive writing-desk; an old wardrobe into a lady's dressing table; an old-fashioned wooden bed being cut down to suit Milady's tastes and present-day requirements, and the restoration of many old antiques and heirlooms.

Figure 3 Chippendale table decorated with carvings in low relief.

Another and even more interesting phase of the work, as carried on in this up-to-date establishment, is the reproduction of old models and antiques. This work is carried out with the strictest fidelity to the design, details and construction of the original style. Much of the material used in this special work was taken from some of the old homes of England and the continent—once more to be used in beautifying the homes of the new world. A large part of this material consists of exquisite old pieces, inlaid with silver, mother of pearl, brass and precious metals, and may be said to have been brought from the four corners of the world. Thus, in addition to the attractiveness and gracefulness of the finished product, there is an added charm, due to the sentiment attached to such old material. If some of these old pieces could talk, what an interesting story they could relate.

The accompanying illustrations, which are reproduced from photos taken specially for the "Canadian Woodworker," show some of the work going through at the present moment. The first illustration, Figure 1, is a view of one section of the cabinet-making department, including some of the largest and more pretentious pieces on which they, at present,

Figure 2. One of a number of mahogany desks for the Bank of Montreal.

Figure 4. Three mahogany pieces attractively executed in Chippendale design.

Figure 5. A number of chairs in oak for the House of Commons, Ottawa.

are working. The lower part of the table, seen in the center foreground, nearing completion, is for the clerk of the House of Commons at Ottawa. It is Gothic in design, measures 5 ft. x 13 ft. 2 in., and is constructed with strict attention to permanency and strength. The top is made of nine-ply straight-grained oak, with a 4 in. cross-band decoration, divided by a 3/16 inch ebony line, around the top. The linen-fold panels, fine tracery work and the exquisite carving on the center panels, hardly discernible in this picture, are beautifully defined and enhance the attractiveness of the table.

The bottom is solid and fitted with a double track, which receives a sliding holder in which the mace reposes when not in use.

The large mahogany desk, shown in Figure 2, is one of a number of single and double desks being made for the St. James St. branch of the Bank of Montreal. The desks are made of mahogany with birch interiors. The standards, of which there are three for each dask, are constructed with 7/8 in. ash cores, cross-banded with 1/8 in. birch veneer and faced with 3/16 in. mahogany. The supports are attractively carved trusses 4 in. in thickness, moulded heavily on the front edges and finished at the base with claw feet. These standards are exceptionally well designed and convey the idea of strength and solidity, so becoming an institution of such conservativeness and dignity as the Bank of Montreal. This particular order is being carried out under the supervision of Mr. Hanna of McMann, Mead & White, a firm of well-known New York architects.

Figure 6. Type of small desks to be used in Parliament Buildings, Ottawa.

The small mahogany stand, shown in the third illustration, is designed specially to hold a large cabinet of fine cutlery. The lines are those of Chippendale and the table is decorated with carvings in low relief and claw and ball feet. This piece was designed to match a Chippendale suite which adorns one of Montreal's palatial residences and which was sold recently by the Henry Morgan Co. for the sum of $6,000.00.

The three pieces, comprising Figure 4, are intended for Milady's boudoir. These are executed in mahogany in Chippendale design. The writing table is exceptionally pleasing in line and proportion, and yet gives sufficient space for a full complement of writing-desk equipment. The front drawer is nicely shaped and it, together with the receptacles on the top, are fitted with loose racks to accommodate the necessary paper, envelopes, etc.

A close examination of these pieces should tend to convey an idea of the subtle charm which attaches to well-designed furniture. The fineness of detail might well receive special attention. This is especially noteworthy for to-day composition carvings are being employed to a large extent to replace hand-carving. Where the decorative scheme calls for carv-

Figure 7. View of the chair department in the plant of Henry Morgan & Co., Limited, Montreal, P.Q.

ings of any kind, this firm make a practice of cutting it by hand from the solid wood.

The chairs shown in the white, Figure 5, are intended for the chamber of the House of Commons at Ottawa. They are made of solid white oak with a deep birch stuffing rail. These chairs are built to give lasting service, both mortice and tenon and dowelling being used in their construction. In addition, heavy corner braces are accurately fitted in each corner and held there by glue and screws. The turnings on the front and rear legs are the same and are decorated with well-executed carvings and finished with square flared spread at the floor line. The front arms and backs are heavily moulded. The covering for these chairs is English pigskin in green. Large square head nails will be used on the gimp line. Only the best in hair springs, etc., will be used, insuring utility and comfort for generations to come.

The type of small desk to be used in the chamber of the Parliament Buildings at Ottawa, is shown in Figure 6. The lower one is for the sergeant-at-arms, while the upper desk, which is one of four, is for the Hansard reporters. There is a certain dignity and charm in the design and proportion of these desks. The embellishment of the ends, including carvings, representing the maple leaf, rose, thistle and fleur de lis, are exceptionally well executed. In fact, it is a matter of pride with the workmen to reproduce these emblems with the strictest fidelity and with every care, as each workman is given the emblem which represents his homeland. Thus the thistle would be carved by a Scotch artisan, while a Canadian would work out the maple leaf. The tracery and linen-fold panels add to the attractiveness of these pieces.

An excellent view of the chair department is shown in the last illustration, Figure 7. It is here where the thousand and one chairs manufactured by this firm are designed and finished. Some idea of the total output of this department may be formed from the fact that during the present year some two thousand chairs of different designs have been put through. The list would include chairs for all rooms of a home as well as for many large public and private buildings. The templates and patterns for these chairs are all numbered and carefully placed away for future use. Thus any of these designs may be reproduced or replaced at short notice and with a minimum of expense, even though several years have elapsed.

The experts in this department are all skilled chairmakers. Many have come direct from some of the larger chair factories in Great Britain. The methods followed are those used by the most noted of Old Country chair makers. This accounts for the fact that the Henry Morgan Co. of Montreal, have earned the reputation of having one of the finest special order chair departments in the Dominion of Canada.

Dignity and Economy in Interior Woodwork

Interiors Influenced by Present Day Furniture—Built-in Features Economical and Attractive—Lighter Interiors Growing in Popularity—How Furnitnre Influences Interior and Even Exterior of Home

By W. H. Shaw

Notwithstanding the troublous business times, and the uncertainty of the future, people must and will build , and if there is a further wave of prosperity will build lavishly. During times of stress they build soberly, cutting out all superflous things, restraining a tendency towards ostentation, limiting their needs as far as possible, and the results are often quite as satisfying in the second period as in the first.

There we are to live and enjoy the result of our labor and have the best part of our being is no place for any sort of pretense. To make the home a successful centre of living rather than simply an abiding place, is one of the most important problems of the day. This means not only the practical plan and pleasing exterior, but quite as much, the satisfying and home like interior. Admitting the substantiality of a house is of more importance to the owner of a house than the consideration of the aesthetic side, there is no reason why the artistic and the substantial should not go hand in hand. The love in the last few years experienced an awakening. After a long period of heedlessness we have come at last to a realization that beauty of form and color is essential to our home life.

Dignity and Good Taste.

An English gentleman gave the following advice to his son, whom he thought was old enough to marry: "Do not marry a prize beauty, because she will not last long enough, and do not marry one whose looks will do discredit to your taste." I have always thought that this gives a good hint to home builders. A home should neither be a peep show, nor a blot on the landscape.

No one knows, until he builds a house for himself, how many problems, of an entirely different nature, he will meet, and how each of these are inter-related with the others. No one problem can be left until the others are settled, because the latest one is likely to unsettle the first, so experienced ones plan the whole house, even to the finish of the interior woodwork and the furnishing of the rooms before the work is actually under way. Suppose for instance, my lady sees a new piece of furniture, which she must have in her living room. It is the very latest thing and upsets her first idea for the finishing of the woodwork. The new finish, which she decides upon is better upon a different kind of wood. With the other wood a different treatment in the hall seems advisable, and this in turn influences the type of design for the front entrance, possibly makes it colonial. A colonial entrance is in keeping with a certain type of exterior treatment and the whole design is modified, by the purchase of one piece of necessary furniture. When the house is planned the furniture should be placed drawn to scale on the plan, the color scheme and type of furniture decided upon before the working drawings and specifications are completed.

Proportions of Rooms.

The living room, in general should be proportioned in the ratio of three to five, which should mean that

the living room fifteen feet wide should be twenty-five feet long, or a room thirteen feet wide would be twenty-one feet long. Of course, this is by no means an absolute rule.

It may be noticed that in speaking of width of the living room the odd numbers of feet have been used, and this is not because there is luck in odd numbers,

Square paned glass in French cupboard doors

but because lumber comes sawed in even lengths. Twelve, fourteen, sixteen and eighteen, are the lengths usually carried in stock, and allowing for about six inches support at each end. If one desires to economize in a very sensible way the stock sizes of joists will naturally be selected. It has been found by experiment that joists two inches by eight inches deep can be used over a span of thirteen feet, and a joist two inches by twelve inches deep over a span of seventeen feet without the floor sagging or feeling shaky.

The shape of the living room should be such that several groups can assemble in it, concerned each with its own subject of conversation, and also so that every one in the room can form a general group. As the centre to which groups naturally gravitate is the fire place, this should be so placed that no one facing the fire place will have to sit immediately in front of a door, or block a natural passageway.

Placing the Furniture.

A fireplace immediately between two large doors, while picturesque in appearance, is often uncomfortable in practice. A large square living room is not as a rule desirable. As dining room tables run from four to five feet in diameter, and when extended to seat eight persons, are from six to eight feet in length, or extended to seat twelve are from nine to twelve feet in length. The width required, with pieces of furniture projecting into the room, for a five foot table is eleven feet. This will give plenty of room for people to sit at the table, and for a maid to serve them properly. This means that fourteen or fifteen feet is wide enough for the actual need of any dining room.

In length, a seventeen foot room is sufficient to seat twelve people, and a fourteen foot is sufficient to seat eight people, unless both ends of the room are blocked with large pieces of furniture projecting into it. Besides the dining table and chairs necessary to seat the expected number of guests, the average dining room furniture consists of a sideboard, from five to six and a half in length, usually projecting a foot and a half. And possibly a china closet projecting about one foot and four inches, and from three to four feet in width. For these pieces of furnitiure there must be wall spaces, and as the sideboard is usually one of the most interesting pieces of furniture which goes into the house, there should be wall space in the centre of one side of the room provided for it. There is a question about the advisability of placing a window above the sideboard, since the silver, glass and china show to much better advantage when lighted from the front, and lose in beauty when lighted from above or behind, for they cannot be well seen against a strong light.

Treatment of Interior Woodwork.

As the modern house is built, the woodwork of the rooms, to a certain extent dominates the room. Its treatment sets the key for the decoration and prescribes within limits, the type of furniiture which may be satisfactorily used. Finished in "Hardwood" or finished in "oak" is often given as the slogan of quality, when a house is placed for sale, as a fine wood calls for good workmanship. With the growing popularity of painted furniture comes a painted finish (enamel) for the woodwork, and in the better class of work, birch or other hardwoods are now generally used under paints. So the old classifications are lost. A painted job may be a very expensive job, with its fine wood and many coats of paint and enamel; while simple ways have been found in the finishing of a hardwood to show the beauty of the grain and enhance the natural color while giving the beauty of the dull finished surface.

The home builder who expects to get the most satisfactory results at the minimum cost, will do well to make a little study of the woods which are available for his purpose both with reference to the way he

Convenient and attractive built-in china cupboards

wishes to use them and also to the local conditions, and market.

Vogue of Light Interiors.

The living room of the small house of but a few years ago, was quite generally finished in some comparatively dark style, and very commonly in dark oak, or some stained pine imitation of it. To-day, however, the popular leaning is towards quite the opposite. The vogue at present is in fact that the room be finished in white or ivory, or in a very light tint. And indeed, it seems to represent a

most commendable notion. It means, for one thing, that, instead of something appearing dark and perhaps gloomy, especially in cloudy days, the room is always bright, and hence endowed with an atmosphere of cheerfulness. Yet, if the matter of it its decorating, finishing and so forth be propertly handled, it will at the same time be easy and in every way inviting. Then, too, this style of finish invariably suggests sim-

A bookcase one side of fireplace and writing desk at the other side

plicity, and this has also come to be regarded a desirable attribute.

The light finished living room is, of course, not restricted as a possibility to the builder of a new home only. The old style, dark finished room of the house built some years ago may be easily transformed into the new style by a thorough overhauling in respect to woodwork, decorations, and soforth. In fact, this is being done quite extensively, and if done correctly the result is no less satisfying than if it had been so handled in the beginning. In making any such changes however, it should be remembered that the furniture must be more or less in keeping with the altered interior and hence may require changing also.

Built-in Furniture Popular.

Built-in features must naturally receive more or less consideration in this connection. Bookcases to suit their position are especially favored, and writing desks and built-in seats are possibilities also. Towards the designing of such features the accompanying illustrations may offer a few appreciable suggestions at least. Bookcases, it will be observed, are shown in a number of them, while in one will also be seen a neat little writing desk of the built-in type.

The woodwork of a room of this sort, whether of ordinary casing and base or if the more elaborate woodwork which is again in vogue, viz., French panelling to the height of the window stool. The woods to be enamelled should be selected from those which are neutral in grain and color. Among the woods which are most suitable for this finishing are birch, gumwood, basswood, maple and the soft non-resenous pines. Especially for the better class of house many good architects, through long and intimate acquaintance with certain hardwoods, tend to specify certain woods as the only base for all enamel treatment. Many of the fine pieces of beautiful enamelled and painted furniture are made of costly woods. The first cost of woods, in such cases, is so small a part of the total cost, with its exquisite workmanship that there is not sufficient economic reason for using less expensive wood. The same may be true in an expensive house, but in much of our home building the same savings are of importance.

Finish Determines Wood Used.

White enamel is a little the more popular as a finish for the woodwork of a room, although old ivory enamel is at least used almost as often. Choosing between the two is probably only a matter of individual taste, for either makes a very appropriate and satisfactory treatment. Both may be obtained by creating either a glossy or a dull or eggshell surface but the eggshell kind is ordinarily to be preferred.

Frequently where the woodwork is enamelled there will also be introduced a limited use of mahogany, walnut or gumwood trim, as is the case in one of the living rooms here illustrated. When not used too liberally, they in fact lend a very pleasing decorating touch, and help to emphasize the colonial effect. However, the light finished living room does not necessarily demand the use of white or ivory, its woodwork is, instead, sometimes painted some very light tint, such as, a delicate shade of French gray. But that the tint be extremely pale, and probably restricted solely to grey or bluish-grey, deserves to be given special emphasis.

Securing Contrast in Finish.

For finishing the light-finished living and dining rooms. Mahogany and walnut are both popular and appropriate, for it not only lends contrast, but is in keeping with the colonial style. Wicker or reed furniture also has considerable favor and as may be realized by referring to the accompanying pictures, is productive of very charming results. It at least helps materially in maintaining the desired bright and cherry atmosphere, and however, is comfortable and somewhat less expensive than mahogany or walnut. Incidently such furniture is often upholstered in rather bright colors, and sometimes with material indentical with the room's drapes, oak furniture is used very rarely and is considered hardly appropriate.

The man who is building either for himself or for others is coming to realize the actual cash value of all these impalpable, and almost indefinable things, which in the past the commercial spirit disregarded. To realize that comfort, convenience and beauty will bring a higher rent and a bigger selling price, as well as secure a more satisfactory home.

Durability of Cypress

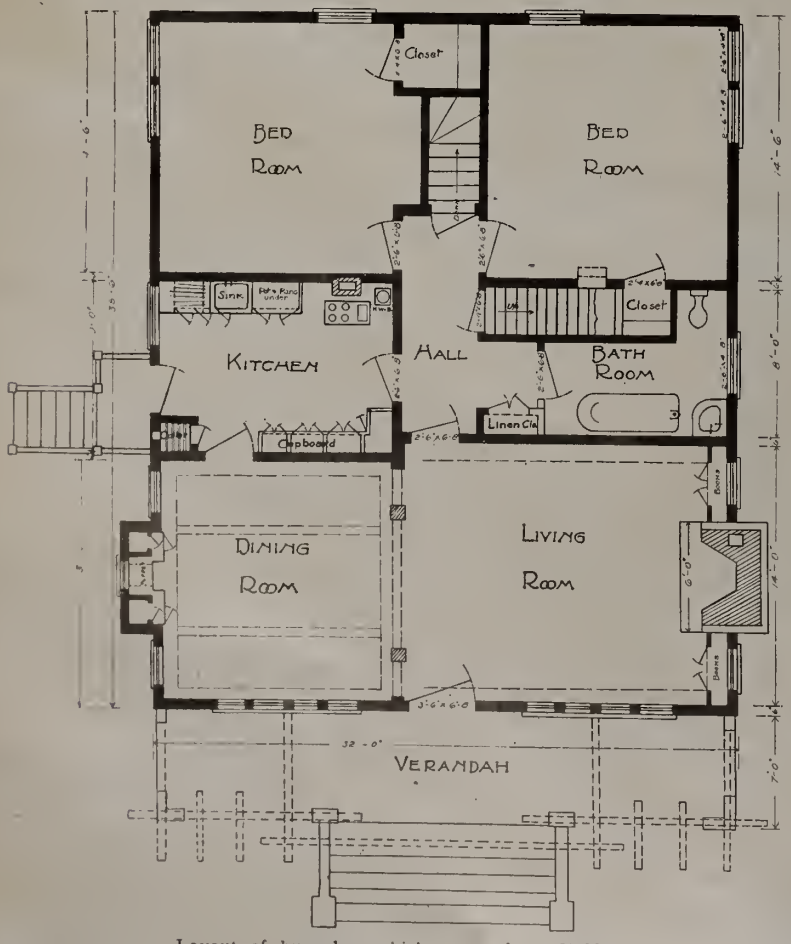
Southern bald cypress is about the most variable in color of any of our native woods, and in different localities is known as red cypress, yellow cypress, white cypress, and black cypress. There is a rather prevalent belief that cypress with dark colored heartwood is the most durable, but the opinion of the U. S. Forest Products Laboratory is that as far as durability is concerned the color of the wood makes very little difference. In service records obtained by the laboratory, any difference in the length of service of red cypress and yellow cypress appears to be due entirely to a difference in the amount of sapwood in the timbers. Cypress trees with light colored heartwood usually have more sapwood than those with dark colored heartwood, and sapwood is not resistant to decay.

The important thing if durability is desired appears to be to select the heartwood of cypress regardless of its shade.

Attractive Bungalows from B. C.

Popular Adaptation of California Design

BRITISH COLUMBIA is, and will be for some time to come, the home of frame building construction, and of late has been turning its energies to the construction of bungalows which are especially adapted to the climate of the Pacific Coast The California bungalow, with a few minor modifications to allow for the winter climate, is receiving special attention in Vancouver, and on account of the cosy appearance and ease in housekeeping is much favored by the young housewife.



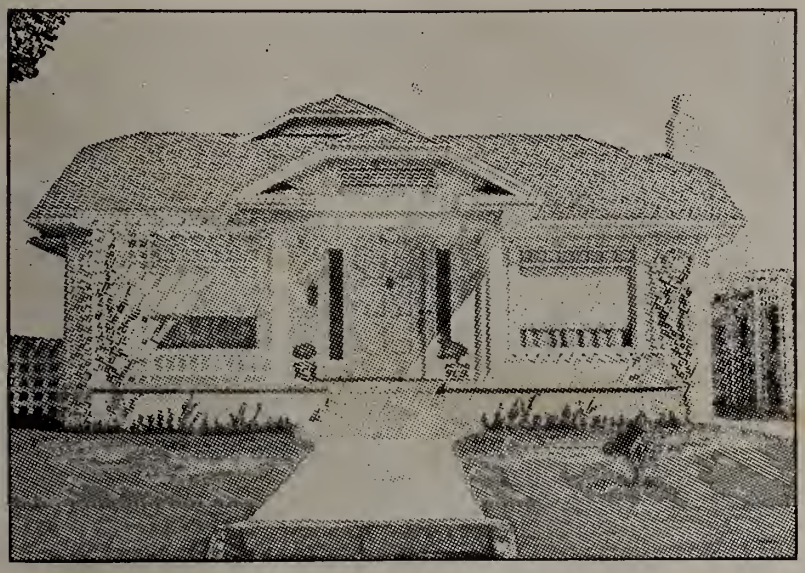
Layout of bungalow which costs about $5,000

To show that the bungalow type of home is adaptable to this climate one has only to inspect the many fine designs that have been erected in Vancouver by Messrs. Faulds, McQueen and Pearce Ltd., on their Shaughnessy Park subdivision. Twenty-one of these cosy, commodious homes have already been constructed and sold, and others are being sold as soon as they go up. Every bungalow is of a different design though all have the many time and labor-saving devices peculiar to this type of dwelling.

Built-in features, all of them convenient and not a few of them novel in their principle, mark the equipment of the bungalows this company has been constructing during the past year. Just as the designs for each of the bungalows are original and show individuality, so the built-in features speak of care and thought in planning. All are practical and useful, further indication of the study that has been put to their preparation. In the kitchens, most of which are buffet design, the cupboards have bins of capacity sufficient for full packages of flour, sugar, etc. Baking boards are drawn out for use and push back out of the way, ironing boards are simply arranged in snug recesses in the wall, a cupboard door closing them in when not in use. The electric wiring is arranged so that a socket for the iron is near the board. For perishable food the ventilated cupboard, with wall-vents to the open air, and slatted shelves, gives perfect air circulation. Similarly, in the bath rooms of these bungalow homes, convenient small cupboards are built in for stowing the many toilet and bath accessories.

Convenient Built-in Features

Interior finish in all these bungalows is distinctive. Plain surfaces mark base-board, window and door frames. Beamed ceilings give a substantial air to dining or living rooms. Wood panelled walls in halls and dining rooms, are the rule. In some of the living rooms tinted enamel finish is used with good effect. The plaster is, in many cases, finished



Comfortable Convenient and Cosy

"The House of the Seven Gables"

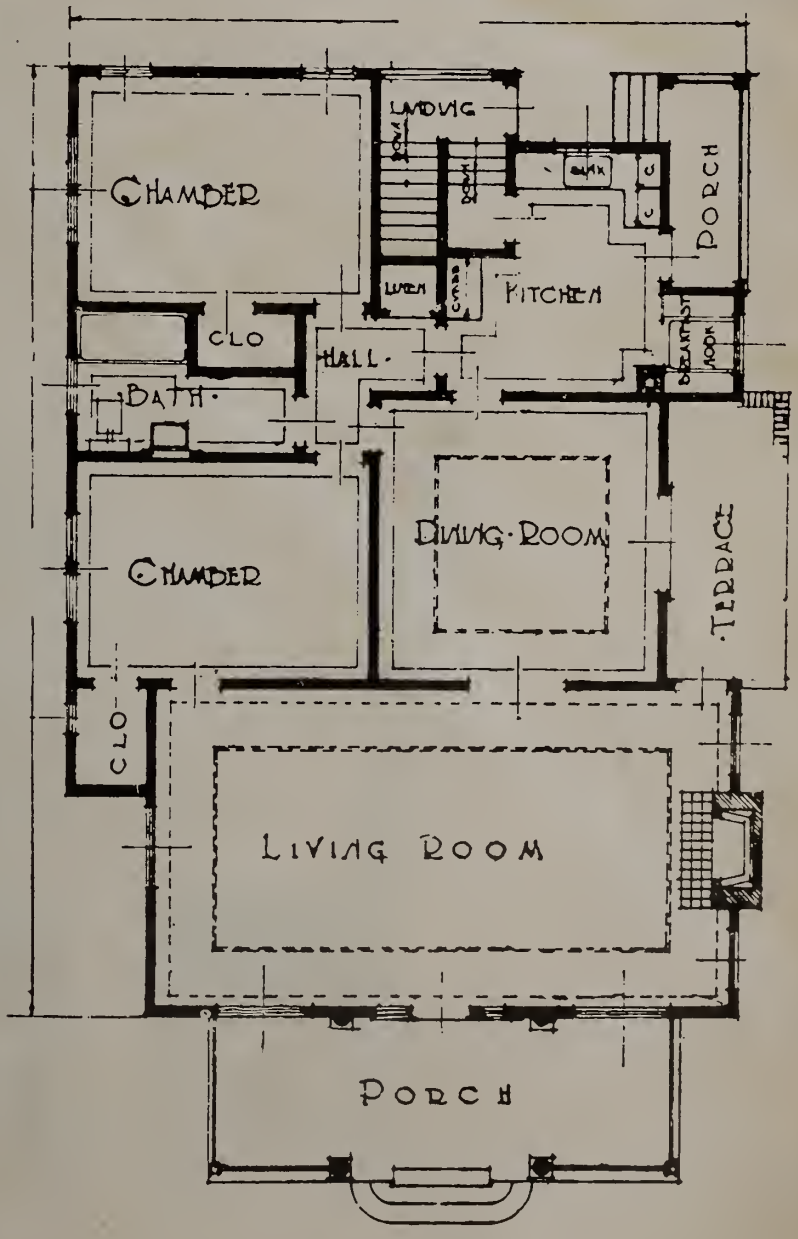
with a brush effect which lends itself to fine tints when the walls need decorating. Book shelves built in, or alcoves for library cases are arranged, in some cases at either side of the fireplace, and in others flanking the archway between dining and living rooms. Very original window arrangements are noted, the most being made of lighting effects. At the same time quaint and cosy curtain draperies are made possible by low casements.

Every house has a fireplace, in all this new bungalow suburb, and each is a guarantee of the height of home-like evenings by the flickering fire-light. The exterior of these model homes is done in cedar shingles, walls and roof. This material for the walls is an aid to giving the broad and comfortable lines which the designer seeks always for the typical bungalow. For color effects also, the cedar shingle is most adaptable. Some of these houses have striking combinations of weathered silver-gray walls, with warm red stained roofs, the trim being flat white. Others have brown stained walls and dark green or red roofs, while the color scheme is varied in others by having a solid green wall stain with a deep red or brown for the roof.

Mr. S. H. Shave, a practical architect and builder of wide experience, has been in charge for Faulds, McQueen & Pearce, Ltd., during the construction of nearly the whole of the houses in this suburb, and many of the designs are original with him, or adaptation of popular favories.

This Home is from Famous Model

"The House of Seven Gables" is the name given to the bungalow illustrated herewith. It is the latest of the many beautiful little homes which have been erected on what Vancouver now calls "Bungalow Row." This attractive dwelling is a creation of the different, the quaint, and the beautiful, and has incorporated in it many convenient features which larger houses often lack. A home of this type should commend itself to those wanting commodious



Layout of "House of the Seven Gables"

rooms, and a style of architecture quite different from the ordinary.

The design of the main floor is especially strong and attention is drawn to the location of the bathroom and its accessibility from either bedroom through the hall. This is a common-sense feature that is omitted in many bungalow plans, the passage from the bedrooms to the bathroom often being through the kitchen or living-room. The living-room is an immense, well-lighted room extending across the entire width of the house. At one end is a large fire-place finished in mineral brick and flanked by built-in bookcases. The treatment of the fireplace in mineral brick is very effective and its warm tints give an unusually cheerful and cosy tone to the room.

To the left of the living-room is a room which, by its location, can be used either as den or a bedroom. It contains a commodious clothes-press and is well lighted by two large windows. Passing from this room one enters a hall which opens in turn on the bathroom, a bedroom and the kitchen. The bathroom is large for this type of dwelling and is very conveniently arranged. To the rear of the bathroom is a large, airy bedroom containing a good-sized closet and lighted by two large windows.

The kitchen has many features which delight the heart of the woman who does her own housework and reflect the care and foresight of the architect who is evidently conversant with the limitations of the usual kitchen. One's attention is drawn to the way in which the architect planned to avoid the thousand and one unnecessary steps a housewife takes in the preparing of a meal in an ill-designed kitchen. The stove, cupboards and sink are so arranged that a step either way brings you from one to the other and the housewife has all her utensils and cooking materials within arm's reach at all times. A large casement window opens over the sink and gives light where it is most needed. To the right of the sink are two large cupboards with outside ventilation for the storage of food supplies. A breakfast alcove with built-in table and benches opening off the kitchen is another charming feature of this bright little room.

That Useful Tea Wagon

What the wheelbarrow is to the farm, the tea wagon is to the household, saving steps, time and danger of breakage every day in the year. With its help even a young girl can arrange or clear away the dishes in a twinkling. When a meal is desired in a hurry its value is accentuated, and the most attractive feature at this time is that the entire meal can be hurried to the table at the same time, thus obviating the vexation of having the articles first served lose a part of their freshness. Besides, even in the most careful hands there is more or less danger from breakage when carried on the tray, and only a small portion of them can be carried at once—these, perhaps, causing undue strain upon the back. But with the wagon, all is different. Treble the normal amount is but child's play.

Nor is the tea wagon a thing to be confined in its service to dining room and kitchen. All about the house there are articles which are shifted from one room to another in ordinary service or for some special reason. Books from the library stray to other parts of the house and are not always returned promptly. The housewife may find that these, with the current periodicals, become a real burden in the picking up, but with the wagon they can be easily returned to their own place.

Furniture Makers Hold Important Meetings

Publicity Campaign Reviewed—Stirring Addresses by Retailers—Dating and Tariff Matters Discussed

The Furniture Manufacturers' Association recently held two very successful general meetings in their board room in the Nordheimer Building, Toronto, one on November 23rd, the other on December 8th. The attendance in each instance was up to the mark, which was gratifying, as it shows the interest the individual manufacturers are evincing in the work of their organization.

In calling the first meeting to order, the chairman, Mr. Anderson, intimated that before any other business was transacted, it might be advisable to take advantage of this opportunity and have a meeting of the Home Furnishings Bureau. He also extended a hearty welcome on behalf of the furniture manufacturers to the retailers present, who had kindly consented to give their views on the publicity work which is now being carried on.

G. O. Luke, of Hamilton, president of the Retail Furniture Dealers' Association, then gave a stirring address. He congratulated the furniture manufacturers on the progressive step they had taken. He was strongly in favor of newspaper advertising and was convinced that if the manufacturers persevered in their publicity efforts, especially newspaper advertising, the industry was bound to reap the benefit.

Bound to Show Results.

Robert Coryell, president of the Adams Furniture Co., Limited, Toronto, Ont., also gave a short address. In his opening remarks he said it must be refreshing to the furniture manufacturers to get a pat on the back and hear kind words from the retail furniture dealers after what the manufacturers had been doing to the retailers for the last couple of years. The publicity work undertaken by the furniture manufacturers was the most forward step that had ever been made in the furniture industry. The results might be slow in developing, but if the activities of the Home Furnishings Bureau were wisely directed, gratifying returns would undoubtedly come. He considered that the work done so far was deserving of the highest commendation. He also stated that his company would be pleased to co-operate with the Home Furnishings Bureau in every way possible, at the same time suggesting that it might be advisable to work far enough ahead that the retailer could be advised in advance of all advertising which would appear so that they could co-operate to the very best advantage.

The different steps taken by the Home Furnishings Bureau since its inauguration were reviewed. Mr. T. Lyle Blogg gave a detailed account of the campaign and explained that at the present time advertising was being carried in 44 daily papers, 74 weekly papers and 11 farm journals. He also stated that the dealers were cordially co-operating. The remainder of the time was largely taken up by a discussion of the plans in regard to the future development of the Home Furnishings Bureau. Owing to the fact that a number of important matters were crowded out of the agenda, it was decided that another meeting would be held on December 8th, so that all arrears of business could be cleared up.

Tariff Brief Prepared

At this, second meeting, the report prepared by the Tariff Committee was accepted, as handed down, and it was agreed that a copy of the report prepared for submission to the Tariff Commission be given to the various trade journals for publication. Other matters in connection with the tariff were referred to the Tariff Committee, who will find it necessary to meet at an early date.

The question of "dating" came up for consideration. There was no reason why any changes should be made, which would have the effect of permitting spring dating. It was considered that dating had been one of the evils of the trade and its elimination had been distinctly beneficial, from every point of view.

Considerable discussion centered on general trade conditions. Mr. Ferguson read a telegram he had received from the secretary of the National Alliance of Case Goods Manufacturers, which represents seven case goods associations with headquarters in Grand Rapids, Mich.,—"Jamestown market on case goods approximately 10 per cent. less than former prices. No buyers. Grand Rapids have made no change in their prices, having some months ago guaranteed against decline to December 31st. Don't expect January prices on case goods in Grand Rapids and Chicago to average over a 12 per cent. reduction from former prices. Not five per cent. of reports that come to me concerning reductions and cut prices can be verified."

New Price Lists to be Issued.

The meeting re-affirmed the recommendation that new price lists be issued at an early date, and further recommended the advisability of issuing some assurance to the retail dealers regarding the stability of these prices, so that they may enter the market, secure in the knowledge that prices will hold for a definite period.

The report submitted to the Tariff Commission was an exceptionally well-prepared document, and dealt with the various phases of the question in a clear, concise and almost dispassionate manner. In speaking of the development of the furniture industry, mention was made of the fact that there are 238 furniture factories in Canada giving employment to 8,000 persons and having a total investment of some $25,000,000. The annual turn-over about equals the capital investment. The wholesale prices of furniture in Canada are to-day based on cost of production and are not in any way influenced by prices prevailing in other countries.

Owing to a much larger market, the furniture manufacturers in the States were able to specialize to a degree not possible in Canada, with the result that their costs on many stable lines are lower than the Canadian industry could hope to attain with the comparatively small population of Canada. Thus in times of slack business and over-production the mass production of American factories enabled the American manufacturers to sell both at home and abroad, and even with present protection, capture a large share of Canadian business. In view of the fact that the present measure of tariff protection has permitted the creation of such a large industry in Canada, it was requested that this same measure of protection be retained in order that the furniture industry may in times of trade depression continue to operate by being able to retain its home market.

Designing a Louis XIV. Phonograph

Outlining the Development of a Design from the Original Idea to the Finished Sketch Many Points that Mould and Influence Resultant Product

By Arthur Kirkpatrick*

There is no royal road to working up a design for a piece of furniture, although there are certain basic, fundamental principles which should be mastered and followed. In attempting to design a piece of saleable furniture, every designer proceeds according to the facilities he has at his command, the environment in which he finds himself and the class of trade that his peculiar ability and efforts are intended to supply.

In referring to facilities, I mean has the man to which the designing is allocated, a fully equipped library at his disposal or is he forced to draw on his imagination or memory for the formation of the attractive and marketable articles that he is supposed to produce? Has he the instruments of his profession—the drawing-board, suitable paper and inks and other similar articles? Is he trained in historical style and is he able to read character and spirit in furniture? It is this last, character and spirit, that give the subtle, inexplainable appeal so often noticed in well-designed furniture.

Environment would include the size of the organization with which the designer is associated. Is the factory a large or small one? Is it situated in the city or town? In what section of the country—east or west? Is he left to his own resources or must he listen to suggestions from the owner of the plant, superintendent and, perhaps, the sales force?

No Set Rules Applicable

The class of trade catered to is another important factor. By this is meant the customer or ultimate consumer. Does price enter into the buying of the raw material? Does the matter of cost influence the design and construction? Is the furniture to be designed so as to be of the greatest use, or is the prime motive to produce a money-maker—an article that will bring the highest price for the least possible outlay?

One will note, upon consideration of the above brief suggestions that no set rules can be applied to designing. There are no cut-and-dried methods, possibly such as enter into the manufacture and selling of lumber, cordwood or codfish.

In order to present a plausible and constructive story to the reader—one in which he will get an intelligent glimpse of the train of thought followed in a designer's mind, we will suppose a case. A salesman returns to the factory with a nice lot of orders and among them he has taken a special order from one of the big customers, say, Smith & Jones.

Smith & Jones are a good reliable house, so we will have to favor them to the extent of this special, "call in the designer," says the manager.

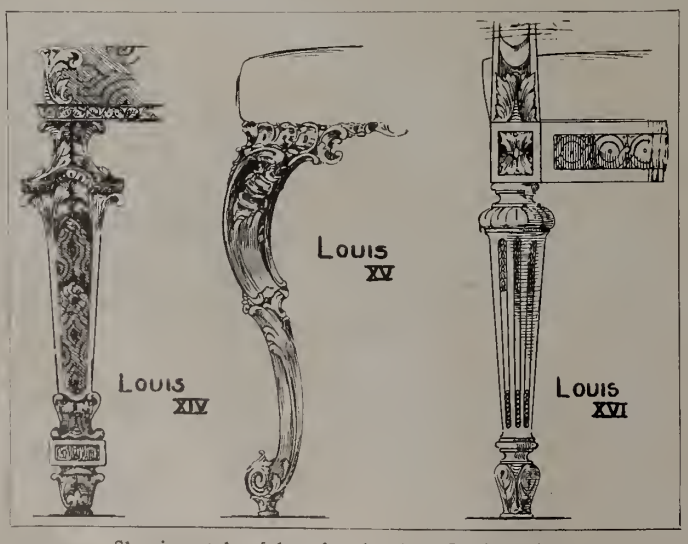
In explaining the situation to the designer the manager rehearses the points of interest as he has received them from the salesman, thus:

"Mac, we have a customer who wants a special made. The order comes to us through Smith & Jones, a house with whom we desire to cultivate and maintain harmonious relations. This customer who lives at Blank has a music room in Louis XIV. and wants a phonograph case in the same style."

Visualizing the Market

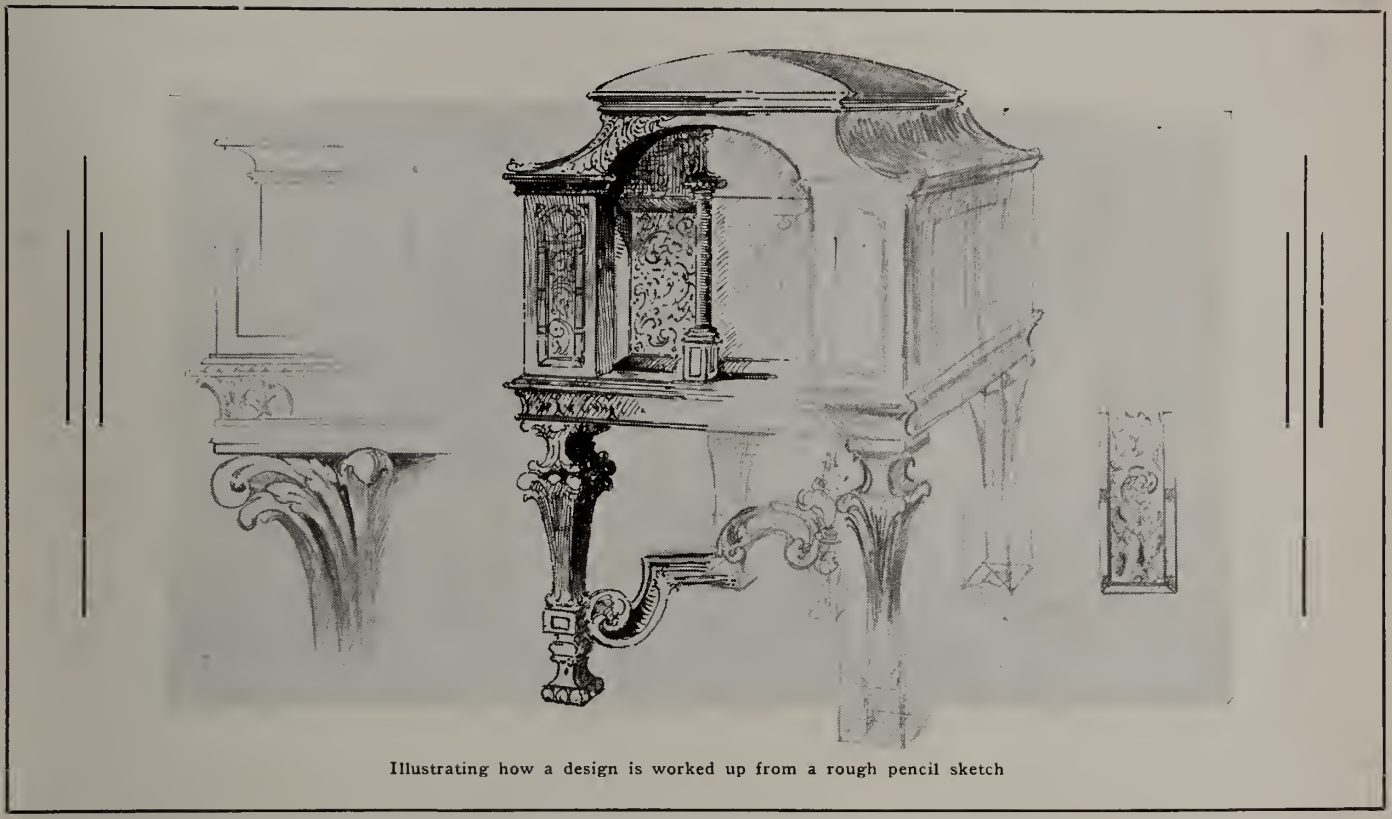
As soon as the manager commences his explanation, the mind of the designer begins to visualize, compare and compile thoughts regarding the task at hand. His first thoughts are of the source or the consumer. He knows that this order is the source from which every shade or degree of style must be drawn. His next thoughts are of location. The city of Blank is cosmopolitan, it has a reputation for culture and refinement. The particular citizen in question, and those with whom he associates, would very likely be of the critically proper kind, regarding a rigid accuracy of effects. Finally he would consider the style, the setting for a Louis XIV. music room would be a large and spacious home with an ample display of richness and grandeur. For the Louix XIV. time is the most spacious and grand in French history—not the gayest, for that was the Louis XV., not the daintiest for that was the Louis XVI., but the large uncompromising proud glory. That is the Louis XIV.

These three— source, location and style—are the mats which the mental kymnastics of the designer are performed upon while he is receiving suggestions and orders from the manager. His next operation is to refresh his memory upon the technicalities of the style. He does this by going over a number of books or illustrations pertaining to that period. After carefully absorbing same, he takes pencil, paper, and sketch-board whereon he makes several sketches or mental impressions which are used in part or as a whole, in making the detail drawing. As before suggested, not every designer can proceed in this way. It is, however, the way that I would proceed under the same circumstances. The method of course is not original, but it is general. Every furniture designer has obtained a part of his method from studies he has made or books he has read, also



Showing style of legs for the three Louis periods.

*Instructor, Grand Rapids School of Designing, Grand Rapids, Mich.



Illustrating how a design is worked up from a rough pencil sketch

from those designers with whom he was associated in his earlier career.

After the designer has formulated his idea into a perspective sketch of that desired piece, he proceeds to lay it out in detail in order that the workmen in the factory may have a pattern for every piece of stock which enters into the case. Each factory has its own technical ideas of construction, and as no two factories have the same kind of equipment, and the men in charge have their own individual systems of working, the general construction of furniture, and the laying out of drawings, rods, and stock bills will vary slightly with each factory. However, in general the workmen and the designer work in conjunction with one another to save time in production and cost to the manufacturer.

In closing it might not be amiss to mention that the break in the heavy scroll supporting the carved ornament under the cabinet is a distinct feature in Louis XIV. style. This break, which is made by a straight offset, is common to many of the ornaments and carvings which adorned the furniture of that period.

Chair Men Hold Record Gathering

The Seventh Annual Meeting of National Association of Chair Manufacturers, which was held in Chicago on November 5th and 6th, established a record in attendance. Sixty-three member firms out of eighty-three were present, not counting chair manufacturers who are not members of the organization.

The roll call established the undeniable fact that business with chair factories is flat and that in most cases production is being restricted and stocks are not being accumulated in the hands of the manufacturer. While hours of operation are being shortened and in some cases to the point of complete shut down of plants, and while undesirable labor is being eliminated and where vacancies occur positions are not being filled, it is noticeable that the invention does not exist with chair factories to reduce the scale of wages and that purpose is worthy of the widest publicity.

For the better part of two days the meeting considered ways and means by which chair values can properly reflect cost of manufacture and secure for the producer a satisfactory margin of profit. It was conceded by all that any reductions now effected would utterly fail to stimulate buying and that for the rest of 1920 no volume of business would be received by chair factories, hence the time in the interval until January 1st should be employed in analyzing the costs in each grade and type of chair produced. An exhibit was presented to the meeting covering a canvass made of retail furniture stocks in Chicago, the exhibit comprised illustrations of chairs now being offered the public and each chair was charted to indicate the price paid by the retailer, the price asked of the public and the percentage of increase of the latter. It is worth noting that on cheap lines of chairs the margin added by the retailer ranged from 40 per cent. to 100 per cent., whereas on medium and higher grades of chairs the percentage added to the factory price ranged from 125 per cent. to 200 per cent.

The opinion of those attending the meeting was equally divided as to the policy best for the chair industry to pursue at this particular time. One-half felt that the prevalent demand existing for price reductions necessitated adjustments of chair values even before the retailers and jobbers have liquidated the stocks which they have on hand. They felt that the lower costs of lumber and leather warranted a reduction in the factory prices of chairs even if losses had to be taken by the manufacturers covering whatever stocks of those materials were on hand and which cost more than to-day's replacement values. They urged that a reduction by the manufacturer of chair values would force the retailer to reduce the prices asked of the public and thus speed up liquidation of stocks in

the hands of the retailers and advance the time when of necessity orders would be placed for chairs with chair factories.

Manufacturers equalling in number those who felt the foregoing reasons should govern, expressed the desire that stability was paramount at this time for chair manufacturers and that any adjustments on a downward scale should be made in an orderly fashion and only through equalizing values in each type and creating new schedules for guidance could reductions be effected without demoralization. These and other arguments were most carefully considered and to avoid arriving at any undue judgment no conclusion was reached at the end of the first day's session. The meeting adjourned over night, and on the following morning the executive committee having conferred on the matter, it was decided that present manufacturing costs warranted a slight reduction in prices. While some lines would be effected more than others the average decline would probably amount to 10 per cent.

Use of Wood in Freight Car Construction

Discussion of Relative Value of Wood and Steel for Construction of Freight Cars—Wood Still Regarded as Most Economical Material—Condition and Grade of Lumber Important

By H. S. Sackett*

The fact that over two billion feet of lumber and timber are used annually in the United States for the maintenance of freight equipment and for the construction of new cars, representing an annual outlay for material alone of over 50,000,000, is ample evidence of the importance of wood in this big industry.

The first freight cars used for railroad transportation in this country were built of wood and this great natural resource has been an important factor in their construction ever since. In recent years steel has competed with wood, especially in the construction of gondola and other types of open-top cars, but whether this change has been an economical one or not remains a question.

Wood Most Economical Material.

From recent studies made of the subject by disinterested commissions, the indications are that even for open-top cars, wood is still the most economical material. With the growing scarcity of timber, however, and the apparently unlimited supply of steel available, it is probable that this latter material will always be a prominent factor in the construction of cars, and especially so, if some agent is found to reduce materially the present high rate of loss from rust and corrosion.

In the construction of the first cars wood was almost universally used for all parts, except of course the running gear. Within the past decade, however, with the introduction of heavy motive power which spells long and heavy trains, it has been found that wood is no longer capable of withstanding the heavy shocks incident to such operation, and it is generally conceded by all car builders that the freight car of the future must be of steel underframe and steel draft rigging.

This limits the use of wood to unimportant parts of the underframe, such as intermediate sills and crossbeams, and to the superstructure of the car. In the case of open-top cars this means only posts and side and end plank and decking, but in box, stock, and furniture cars, etc., it means also siding, lining and roofing.

Steel vs. Wood for Open-top Cars.

To take up the question of open-top cars first, statistics gathered by operating officials of some of the larger railway systems seem to indicate that the cost of maintaining steel gondola cars over a period of years is greater than for composite (wooden and steel) cars of the same type. The data collected show that all-steel gondola cars in their twelfth year of service cost over 36 per cent. more to maintain than did the composite gondola. Of course, it is probable that during the first five years of its life the steel gondola cost less to maintain, but it is felt that taking the entire twelve years as an average, the cost would be more for the maintenance of the steel than the composite gondola.

It is furthermore interesting to note that but 60 per cent. of the composite gondolas in service required repairs, while 72 per cent. of the steel gondolas were obliged to be brought to the shops. The actual time that a car is in service and earning money for the road is an important consideration in determining its general utility. It is also interesting to note the conclusions in favor of the composite gondola, which are as follows:—

The initial cost of the composite gondola with the present prices of steel is less than the all-steel gondola.

The composite type of car costs less to maintain than the steel gondola.

The sides of the composite car do not bulge as do those of the steel car.

The records show that while the composite car costs more to repaint than the steel car, it does not require painting as frequently.

A large portion of the repairs to composite cars can be taken care of at other than steel-car shops.

Certain properties in coal cause corrosion to steel, and wood is not affected by them.

Table 1 shows the annual cost of repairing freight cars since 1908. It will be noted from this table that the cost of repairs per car has increased from $59.30 in 1908 to $80.30 in 1914, an advance of over 35 per cent.

Table 1. Annual cost of repairing Freight Cars

1908	2,089,302	$59.30	1762	104.5
1909	2,073,606	59.70	1768	105.5
1910	2,135,121	65.50	1821	119.5
1911	2,117,644	65.10	1815	117.9
1912	2,140,687	65.50	1858	121.5
1913	2,209,533	.74.70	1802	134.6
1914	2,263,015	80.30	1565	125.8

This higher cost is due, of course, to a number of factors, but it is felt that no small part of it is due to the use of steel, which requires a greater outlay for material and a higher cost to repair, owing to the fact that it takes longer to make like repairs on a steel car than on a wooden one. It must also be borne in mind that this higher cost is very largely due to the much rougher usage to which freight equipment is now subjected. In recent years the freight business of the railroads has grown enormously, and has necessitated the construction of gravity yards for switching, and the use of fewer switchmen per cars handled than in

*Asst. Purchasing Agent, Chicago, Milwaukee and St. Paul Railway. Address before American Society of Mechanical Engineers, New York, December, 1920.

former years. This has resulted in severe handling of freight equipment, and is probably responsible to a greater degree than any other factor for the increased cost of repairs in recent years.

Steel vs. Wood for Closed-top Cars.

In the case of closed-top cars, such as for example stock, box, and furniture cars, there is but little doubt that under present railroading conditions the understructure should be of steel with a wooden superstructure. The steel understructure is required to withstand the shocks of service and to give rigidity and stability to the car, while the wood is desired to give lightness and general utility to the body. Some all-steel box cars are in use to-day, but their heaviness and the fact that nails and cleats cannot be used in them to brace and hold the lading, are strong factors against the use of this material. It has not met with favor with shippers generally and probably will not as long as wood continues to remain available. No material has yet been discovered which combines the properties of strength, lightness, availability, and ease of working such as possessed by wood, and until such a material is developed and made available, wood will undoubtedly continue to be universally used for the superstructure of freight cars.

The dead weight of cars is also an important factor in considering the cost of and earnings from freight haul. There is no doubt but what the excessive weight of the all-steel car has been one of the most deterrent factors to its general adoption in freight-car construction, and this fact together with its lack of readily available repair parts and the large expenditure required to equip shops to efficiently handle all-steel equipment, have combined to retard and limit its use.

Graded Lumber in Car Construction.

It seems pertinent to say a word at this time as to the grades of material required for the different parts of the body of the car. In the early days when the supply of wood in this country was thought to be inexhaustible, clear grades of wood were generally demanded by the car builders, and in the construction of new cars this is generally the practice at the present time, especially for car roofing and siding,—sound-knotted stock being used for decking and lining. Some of the more progressive railroads, however, have gone a step further in recent years and many are now using sound-knotted stock for siding and roofing for repair and maintenance work. There is no doubt but what such a practice is economical and based on sound judgment, for certainly there is no necessity for using clear material for the repair of many classes of freight equipment, the life of which may not be in excess of seven to ten years. One large railway system which not only constructs its own cars but does repairing on a large scale, has adopted the following practice as to grades:—

For New Cars

Siding	No. 2 Clear and Better Fir
Roofing (double board roof)	No. 2 Clear and Better and Select Common Fir
Roofing (metal-covered)	Select Common Fir
Lining	Select Common Fir
Decking	Select Common Fir

For Repair Work

Siding	No. 3 Clear and Select Common Fir
Roofing	Select Common Fir
Lining	No. 1 Common Fir
Decking	No. 1 Common Fir

On this particular railroad the saving on this amended practice amounts to over $500,000 per year, and its economy is apparent.

As far as specifications for end sills, door and side posts, belt rails, etc., are concerned, practice varies widely among the various railroads. Some will insist on oak for such purposes, and others have gone to fir and pine. With the rigid steel underframe it is believed the use of soft woods is more justified than ever for posts and belt rail, but unless well protected with steel plates it is believed the use of oak end sills is still to be recommended. Oak and other hard woods are becoming more scarce and higher in price each year and it is felt that the general practice very shortly will be pine or fir end sills properly reinforced with steel.

Some Advantages of Wooden Cars.

An important feature of car construction which is decidedly in wood's favor, is its general ease of working and adaptability to repair, and this is brought about not only from its qualities which make it easy to cut, saw and shape, but also by its almost universal availability. We have been a wood-using nation for over a century, and artisans familiar with its properties and able to work it, are always at hand.

It is also rather curious that the salvage value of wooden cars is greater than that of steel cars, and no one doubts this who has seen the two types of cars in a seriously wrecked condition. The wooden car may be quickly and easily repaired, while the steel car is only rehabilitated at a high cost, or for the most part is fit for the junk pile.

The Importance of Well-seasoned Wood.

Before using wood in the building of freight cars it is vitally important that it be well seasoned. When our grandfathers built a house they expected it to last a century, and it usually did, for they took great care to properly season the wood before putting it to use. In the houses nowadays, however, we use wood almost before it is dry from the saw, and the result is that our American frame houses to-day are old at fifteen or twenty years and we do not get anywhere near the service out of the wood that we should. Too often to-day we also see freight cars built of green lumber and timber, with the result that within a few months the bolts are loose, the wood having shrunk away from the original fastenings. This causes rapid deterioration and large timbers often quickly rot, particularly those containing sapwood.

It is safe to say that every railroad in the country should at all times carry on hand an eighteen months' supply of oak and other hard woods and a twelve months' supply of fir, pine, and other soft woods. All this material when received should be properly piled for air seasoning, and in the case of clear material used for important parts, such as car siding, should be run through the dry kiln just prior to use.

Increasing attention has been given in recent years to the preservative treatment of certain parts of freight cars, and experiments have been made by some of the more important railway systems in the treatment of such items as stock-car decking, side and intermediate sills, roofing, etc. While these experiments have not been conducted for a sufficient length of time to determine actual results, the indications are that the preservative treatment of such car parts as are particularly liable to decay is profitable and will shortly be adopted as standard practice by the more progressive railroads. The conclusion is inevitable that the superstructure of freight cars will continue to be of wood as long as it is available at a reasonable price.

All-Season Combination Door or Window

A Good Line for Spring or Fall—Strong, Attractive Frames with Removable Panels—Makes Efficient Combination Screen or Storm Door or Window—Many Advantages Which Make Strong Appeal

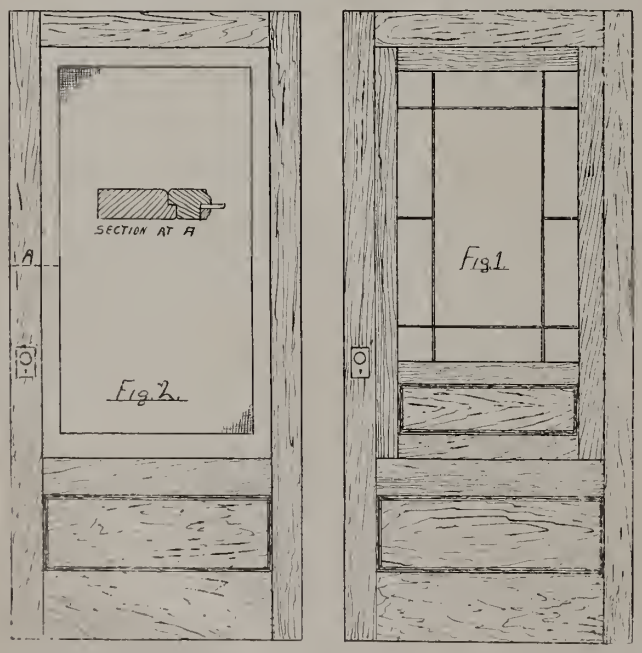
By H. A. Rolphe

It is at this season of the year that the thoughts of many home-owners are turning towards outside windows and storm-doors as a protection against the wintry blasts to come. Not only do well-made, snugly-fitting storm-doors and windows tend to make the home warmer and more comfortable but they also help to keep down the fuel bill and reduce the cost of heating the house. This reduction in heating cost will not only pay a handsome interest on the investment required for these doors and windows, but will return the entire amount, so invested, in a season or two.

In view of the fact that these doors and windows are used for a short period and then replaced by screens for summer service, a type of combination screen and storm door and window has been designed and placed on the market. The advantages of this type of door are such that they make a strong appeal to the average person and as a consequence are in strong demand.

Both Economical and Efficient.

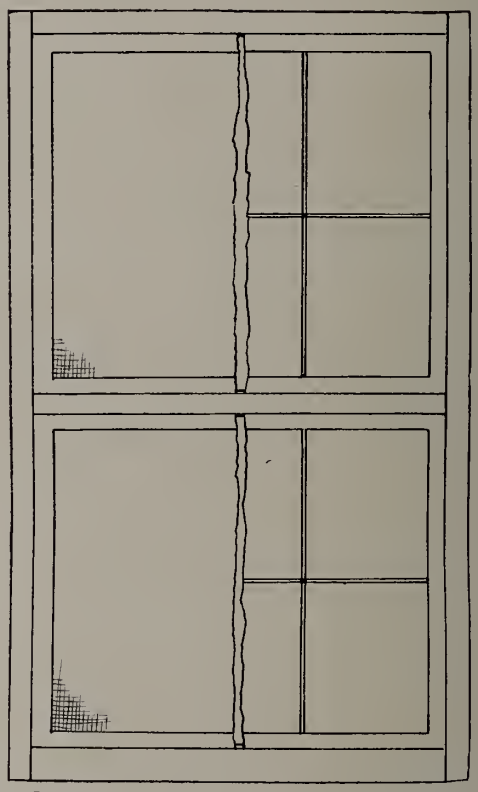
Combination sash and doors are shown in the accompanying sketches. The same frame is used the year around and need never be taken off its hinges, the panel, only, being changed to suit the different seasons.



Convertible all-season door for year round service

As the frames and insert panels may be used in different combinations, a choice of a number of pleasing designs may be offered. Thus for the storm door, the frame might have only one panel, as shown in the cut, while the removable section might be made up with one, two or three panels or might be made with a variation in the size and arrangement of glass. In such an event, with a minimum of stock, the customer could be offered a considerable range of designs. The same applies to the combination screen and storm window.

Enumerating a few of the advantages should indicate just how strongly this type of door, or sash, should appeal to the practical man. One door frame with two insert panels, one glass and one screen, replace two doors. Only one set of hardware and one fitting is required. The labor of hanging the storm doors in the fall and the screen door in the spring, is eliminated. The



Combination screen and outside window frame

change is made so readily and so quickly that there is no excuse for the house not being protected against flies in the early spring or against frosts in the early fall. As the doors or windows are well made, they should last as long as the house itself. Such an arrangement is convenient, economical and practical.

Details of Construction.

The inside of the opening in the frame is rabbetted to receive the insert or panel. This panel goes in flush, improving the appearance of the door. The panel may be held in place with either screws or buttons. Probably the best arrangement is an invisible steel button which is inserted in the edge of the frame and worked with a screw driver. Whatever method is employed it should be neat and inconspicuous so as not to detract from the appearance of the door and become an eyesore. The panels should fit snugly and be held in place in such a manner as to prevent rattling. In actual practice the storm panels for either window or door are sent out with or without glass as required.

Windows of this type are usually hung from hinges at the top, with a convenient catch at the bottom. Thus in winter they may be swung open for venti-

lation. This eliminates the sliding pane or ventilator or the holes at the bottom so common to storm windows. In the case of the window, two panels are used and may readily be removed for cleaning—an added advantage.

Here is an opportunity for the wide-awake planing-mill or sash and door man to take up a new and popular line and make a few extra dollars as well as providing work for his plant. It may require a little aggressive salesmanship to put it across, but that is all in the day's work. The next time you are asked for a storm sash or door, talk combination and see what happens. The same applies next spring when you are asked for screens and screen doors. In making the screen sections, it would be advisable to use non-rusting wire whenever possible. While the first cost of such wire may be high, it is the cheapest in the long run.

Are You Applying Your Burdens Properly?

A Review of Burden Applications—Very Elusive Factor of Cost—Division and Application of Overhead—Suggestions for Equitable Application—Inefficient Methods Fraught with Perils

By H. T. Diderch*

It is only in rare instances that a manufacturer will admit that his cost-procedure is faulty and, most emphatically, not hazardous—still, in the majority of cases an examination of their methods reveals the fact that these same systems are in direct violation of the fundamental principles on which equitable cost results depend.

Every authority on costs will agree that "Burden" is the most elusive factor of cost, not only as concerns its derivation but its application as well; and the final costs of a cost system that is most scientifically devised in all other respects, will be found sadly wanting if burden is applied incorrectly; i.e., if the "unit of measure" for burden is basically wrong.

What follows herein will, therefore, be directed toward pointing out the more glaring mis-applications of burden and also what is considered the ideal procedure, taking into account both the factors of accuracy and practicability.

Per M. Board Feet of Material Plan.

This plan of burden application is perhaps the least effective of all the plans commonly used. From a past operating period, it is determined that the total burden or overhead of the plant is equivalent to, say, a flat rate of $64.00 per thousand board feet of the material used. On the surface, this may appear to be a fairly equitable basis for applying burden, but the plan is very misleading and it actually invites disaster whenever used. Applying this principle to two widely different classes of work, viz., moulding and casework, will illustrate its hazards, thus:

Example "A"
1,000 lin. ft. Moulding

Material—400 board feet	$60.00
Labor—18 hours	12.60
Burden—400 ft. b.m., at $64.00	25.60
Total cost	$98.20

Example "B"
1 Kitchen Cabinet

Material—150 board feet	$22.50
Labor—42 hours	29.40
Burden—150 ft. b.m. at $64.00	9.60
Total cost	$61.50

It is apparent, from the foregoing illustration, that applying burden on a basis of the board feet of material involved, is a ridiculous procedure, even though the plan were further refined so as to produce different rates for the different types of work. The quantity of material required for a job bears only the slightest relation to the burden factor, hence this plan must be discarded.

*Millwork Cost Information Bureau, Chicago

The Percentage of Labor Plan.

Under this plan the burden element is provided for by adding a fixed percentage, say 145 per cent. of the direct labor cost. It is based on the theory that burden or overhead increases in direct proportion to the cost of the labor required to produce any given article. Undoubtedly burden consumption does depend, within certain limits, on labor expended, but not on the value of the labor expended.

This plan is preferable to a considerable extent to the "per M of material" plan but it is not conducive to fair or much less accurate results. Its fallacies are best demonstrated in this fashion: Two sawyers are engaged in cutting up plain red oak for finish. Brown, a very efficient sawyer, receives a wage of 70c per hour, while the other man, Smith, is less expert and is paid but 60c per hour. The cost calculation for both men, considering a work period of eight direct hours, would be:—

Example "C" (Brown)

Labor—8 hours at .70	$ 5.60
Burden—145%	8.12
Total cost	$13.72

Example "D" (Smith)

Labor—8 hours at .60	$ 4.80
Burden—145%	6.96
Total cost	$11.76

Whether or not Brown's cut resulted in a greater net footage than Smith's, it is evident that the burden charged against Brown is excessive, or otherwise that charged against Smith is too low. Both men work continuously for eight hours and in each case the actual burden consumption should be identical, or, at least, substantially so. The heavy factors of burden, floor space, heat, light, water, etc., are the same for each operative and, while Brown may have consumed a trifle more power and oil and perhaps the wear and tear on his saw was just a little greater, these differences would be hardly perceptible and, under no circumstances, would equal 17 per cent. more than Smith's burden.

Then consider also the case of two benchmen, Jones and Young. Jones, who is a skilled artisan performing such work as carving out stair rail crooks, assembling radius stringers, etc., is paid 80c per hour. Young is an apprentice, who nails up cap trim, com-

mon porch posts, etc. His rate is 50c per hour. Figuring their respective costs for a period of eight direct hours would show results as follows:—

Example "E" (Jones)

Labor—8 hours at .80	$ 6.40
Burden—145%	9.28
Total cost	$15.68

Example "F" (Young)

Labor—8 hours at .50	$ 4.00
Burden—145%	5.80
Total cost	$ 9.80

Here again is another pronounced miscarriage of the theory of the "percentage of labor" plan. The difference in applied burden is most astounding; in fact, it would appear on the surface that efficiency tends to high overhead, whereas, actually, the reverse is true.

The Per Man-Hour Plan.

This plan of burden application provided that a flat rate per hour, say 97c, is added to the direct labor cost per hour. Applying the man-hour burden rate to the time of a high-priced and low-priced man for a period of eight direct hours produces the following results:—

Example "G"

Labor—8 hours at .80	$ 6.40
Burden—8 hours at .97	7.76
Total cost	$14.16

Example "H"

Labor—8 hours at .50	$ 4.00
Burden—8 hours at .97	7.76
Total cost	$11.76

It will be observed that the "man-hour" plan of burden application, which involves charging for the ust of the factory's equipment and its maintenance, on a basis of the time during which these facilities were in use, is basically sound. It precludes the possibility—as in the "per M of material" plan—of placing an exorbitant burden against those types of work of which the bulk of final cost is material, or an inadequate burden charge on those classes of product that consist largely of labor. Neither will this method—as does the "percentage of labor" plan—saddle on the high-priced, efficient workmen an excessive amount of burden and permit less skillful workmen and novices to absorb only a small burden, when, by reason of the additional supervision that they require and the spoilages that they are responsible for (which offset the small saving in the supplies factor of burden), they, by every law of logic and expediency, should absorb the same factory burden rate as the efficient workmen.

The foregoing discussions do not contemplate any refinement of the several plans mentioned, but in justice to these methods it must be stated that they are sometimes developed to a higher plane. For instance, the burden rates used in the examples consider only one rate for the entire product. Quite frequently a line of demarcation is drawn between the burden as applied to lumber, machine labor and bench labor and for the disposition or sale of the product. These refinements tend to create a somewhat better balanced procedure but they will not dispose of the irregularities already pointed out.

The M. C. I. B. Plan.

This plan will be recognized as embracing the merits of all the previous methods without, however, maintaining their discrepancies.

Every woodworker engages, to a certain extent, in what may be termed a jobbing business; i.e., he sells some commodities that for one reason or another are not produced in his own plant; viz., glass, stock doors and sash, roofing, sash cord, pulleys, weights, screen wire and frequently all veneered doors, except, perhaps, those that cannot be obtained from other sources within a reasonable time. Hence, it is absolutely necessary to provide a burden rate for disposing of items of this nature and, with this end in view, the M. C. I. B. plan makes a clear distinction between the actual manufacturing and the disposing or selling units. In other words, the factory cost, or the cost of all items in their manufactured state is determined first and the charge for warehousing, packing, delivery, selling and administrative expenses is then added as a percentage burden of the factory cost, the addition of the two costs producing total cost.

This plan takes cognizance also of the fact that lumber before entry to the factory proper is subject to burdens that bear no relation—from a cost aspect—to the operation of the factory itself, for which reason lumber yard and kiln costs are diffused only over the material handled through these units. Those expenses relating solely to factory production are segregated as to machine and bench operatives, so that the direct machine and bench men may be burdened at a rate reflecting their respective proportion of the factory burden.

A distinction between machine burden and bench burden is clearly necessary when it is borne in mind that the machine men consume a much heavier portion of investment in the form of the machine equipment itself, repairs, power and supplies, than do the benchmen. Both classes, of course, are subject to one broad, general burden for floor space, heat, light, supervision, etc., and this element is distributed equally to each class of workmen.

Summarizing the unit burdens as they exist in this plan, there are then five basic rates, to wit:—

1. Lumber—yardage and handling burden, which is expressed as a flat rate per thousand gross board feet.
2. Lumber—kiln burden, which is expressed as a flat rate per thousand gross board feet.
3. Machine burden, which is expressed as a flat rate per man-hour.
4. Bench burden, which is expressed as a flat rate per man-hour.
5. Commercial burden, which is expressed as a percentage of the factory or manufactured cost.

Burden Compilation.

There are those who argue that a commercial burden is unnecessary and that by reason of its being applied as a percentage of the factory cost it produces results not in keeping with the burden actually expended through the commercial expense units. However, actual analysis of the operations of more than one hundred and fifty concerns, reveal the fact that the traffic in commodities not produced in the mills of those companies, aggregates quite a healthy figure and, therefore, there remains no alternative but to set up a commercial burden. Moreover, the percentage plan for commercial burden is not contrary to the burden that actually occurs for this portion of a mill enterprise. A mahogany job should be burdened with a greater amount of commercial expense than the same job in yellow pine, for the reason that the use of mahogany requires additional expenditures for insurance and taxes; the interest on borrowed money would

be proportionately higher and the amount of interest for vested capital would increase also. There are a number of other items coming under the head of commercial expense, such as bad accounts, errors not chargeable to the factory, executive salaries, and so on, which likewise would increase in proportion to the material value.

It must be remembered, of course, that a certain mean average cannot be dispensed with under any system of cost accounting and, while this condition cannot be entirely eliminated, it can be minimized and will be, through the employment of this plan. A recalculation of the earlier examples presented herein will furnish conclusive proof of the superiority of this method; and regardless of whether or not a mill operator engages the staff of the Millwork Cost Information Bureau for devising his cost system, he should, nevertheless, accept its burden plan as reflective of the best that is otainable.

Without any attempt at technical elaboration, this subject may be briefly depicted by means of the following statement of costs. These figures are taken from an actual cost audit and have been revised only so far as to eliminate odd numbers, thus making the process of burden compilation readily discernible. Each of the burden units; i.e., items five, six, seven, eight and nine, include its proper share of interest on investment for land, buildings, equipment and average stock; taxes on the same items; depreciation on buildings and equipment and insurance on buildings, equipment and average stock, and, of course, also the supplies, repair and labor expenses peculiar to each unit.

Cost Statement—12 Months

Direct Material		
1. Lumber (1,000,000 board feet)		$ 50,000.00
2. Glass, veneers, screen wire, pulleys, weights, cord, stock millwork, etc.		14,000.00
Direct Labor		
3. Machine labor (26,000 hours)		18,000.00
4. Bench labor (40,000 hours)		26,000.00
Direct cost		$108,000.00
Yard and Factory Burden		
5. Yard expense (1,000,000 bd. ft.	$ 6,000.00	
6. Kiln expense (500,000 bd. ft.)	4,000.00	
7. Machine expense (26,000 hours)	13,000.00	
8. Bench expense (40,000 hours)	12,000.00	35,000.00
Factory cost		$143,000.00
Commercial Burden		
9. Warehouse, delivery, selling and administrative expense		$ 28,600.00
Total cost		$171,600.00

The respective burden rates would be calculated in this fashion:—

Lumber—yardage and handling burden—Item No. 5, yard expense $6,000.00 divided by 1,000,000 board feet handled equals $6.00 per M.B.M. burden rate.

Lumber—kiln burden—Item No. 6, kiln expense $4,000.00 divided by 500,000 board feet dried, equals $8.00 per M.B.M. burden rate. This rate is in addition to the $6.00 per M.B.M. rate for yardage and handling.

Machine burden—Item No. 7, machine expense $13,000.00 divided by 26,000 hours, equals 50c per hour burden rate.

Bench burden—Item No. 8, bench expense $12,000.00 divided by 40,00 hours, equals 30c per hour burden rate.

Commercial burden—Item No. 9, commercial expense $28,600.00 divided by factory cost $143,000.00, equals 20 per cent. burden rate.

Application of the Burdens.

Under the M. C. I. B. cost plan, the burden application to a cost record of 6 yellow pine stair newels, using the foregoing rates, would be:—

Example "I"

Material		
Delivered purchase price 1" B & B yel, pine	$90.00	
Yardage and handling burden	6.00	
70 board feet BM (including waste) at	96.00	6.72
Machine		
Labor, 3 hours	2.00	
Burden, 3 hours, at .50	1.50	3.50
Bench		
Labor, 28 hours	20.10	
Burden, 28 hours, at .30	8.40	28.50
Factory cost		38.72
Commercial burden 20%		7.74
Total cost		$46.46

If the item in question involved the sale of a veneered door purchased from another plant, or perhaps some such commodity as a light of art glass—the assumption being of course that neither of these articles would be produced in the plant under consideration—then the cost of calculation would confine itself simply to taking the delivered purchase price and adding thereto commercial burden, viz.:—

Delivered purchase price	$30.00
Commercial burden 20%	6.00
Total cost	$36.00

If your present burden procedure is along the lines of either the first, second or third plans, you had best revise to the latter method. The others are too unsound, ineffective and perilous to be tolerated in an industry that, aside from its cost problem, involves probably an over-abundance of still other difficulties.

The Match as a Deadly Toy

The use of matches as a plaything is a very dangerous habit. In the province of Ontario during the year 1919, one fire in every eight originated through children playing with matches; and they thus wantonly destroyed more than $361,000 worth of valuable property, besides sacrificing several innocent lives. Even in the hands of careless men and women many fires are caused by thoughtlessly throwing a match in a waste paper basket, or pile of rubbish, before it is quenched. A good plan is to break the stick in two and then you will be sure that there is no fire in it.

We All Make Mistakes

In the rush of putting through the big Annual Furniture Number, several errors inadvertently slipped past the watchful eye of the proof-reader. On page 122 the Canada Furniture Manufacturers' line was referred to as C. M. C. instead of C. F. M., while again on page 147 Crooks-Ditmar Co., was spelled Crooks-Dettman.

If the operator of a planer were to count the number of threads per inch on the screw which raises and lowers the table, he will find this knowledge of assistance in setting up for different thicknesses.

Would Training Improve Your Foremen?

Foremen Training Not Receiving Attention It Deserves—Are We Behind Americans In This Respect?—Qualities Desirable for Successful Leadership—Enlist Aid of Department of Education

By S. E. Saunders

In every industry there are three links in its industrial chain, and as no chain is stronger than the weakest link, the writer wishes to lay emphasis on what he considers to be the weakest link, namely, the link which binds the executive to the working force—"The foremanship link." It must be more and more realized that no matter how competent the men employed, they are not able to do thoroughly satisfactory work without the aid of effective foremanship.

The foreman's job, the development of his talents and the developing of his character so that he may become a popular and genuine leader of his help and a reliable representative of his employer, requires attention. This attention cannot come too soon if we in the woodworking industry are going to follow the lead set by other industries, for we are reminded in nearly every industrial periodical that comes to us from our friends to the South, that they have already set the pace in this direction and it is "up to us" to fall in line.

Of Vital Interest to Industry.

Why should we be so far in the rear. We have the industries and they in turn have the equipment and men to operate them. We must "be up." The time is opportune. We should be developing, not only mechanics but leaders or "foremen." How then shall this be brought about Let us consider for a moment the responsibilities and duties of a foreman. The term "foreman," as commonly used, means a man having a bossing job, one who is in direct contact with the working force, without regard to any special name that he may be known by in any certain plant. A man taking a foremanship must also take on the bossing responsibility that goes with that particular supervising position. Within the limits of that job he is both a supervisor and a manager. The extent of his responsibilities as a superviser and as a manager are, of course, determined by the organization for which he works.

A foreman in a machine shop might be responsible for the quality of the steel used on the different jobs or a foreman might be responsible for the protection of his stock; as in the case of a lumber plant, viz., the proper protection of the stock from the weather and against warping. A foreman might be responsible for the use of the necessary equipment to turn out a given product, as in the case of a foreman of a furniture factory making desks, etc., where he might be responsible for using the various woodworking machines to carry on certain operations rather than doing the work by hand. Indeed the exact duties of a foreman depend on the product of his department and the organization with whom he is connected.

Qualities Desirable in Foremen

The duties vary according to the organization in which the foreman works. Another question—How are we going to judge or measure a man so as to decide his ability or suitability to fill a position as foreman, and what is required in him, In a modern plant a foreman must possess three outstanding qualities. First he should be a thoroughly practical man, well accustomed to and trained in the technical aspects of his work. Secondly, he must know how to plan and organize the work, how to route the material through his department in a manner most conducive to efficiency and with the least loss of time. Thirdly, he must be able to handle his men.

We all know this is the day of specializing. We have the cut-off man, the rip-sawyer, the sticker hand, the shaper hand, the bandsawyer, and so on, all the way to the shipping room, but the men who can take a drawing or sketch of a piece of furniture, and the machinery and lumber required to produce it, do their own machine work, then go to the bench and put it together, are becoming very scarce indeed, and such a man should be valued very highly, provided he has the speed to be profitable. The writer contends that a man to be a capable foreman in any factory, should be able to do so; otherwise how is he sure the work is being done systematically.

Co-operation of Department of Education.

Now if our employers of labor would get together and ask the Department of Education for a qualified instructor to train foremen, they would at least be accorded an attentive hearing, and in all probability their request would be granted. The writer feels sure that there is an immense, undeveloped field in which to work, and, taking the three divisions mentioned, there, certainly, is room for a large amount of instruction to the betterment of the whole industry.

The reader may surely ask,—Where is the Department of Education going to get instructors capable of instructing or training foremen? There are practically two sources from which instructors might be secured, —industry and the schools. Under ordinary conditions an instructor drawn from the schools would be called a "teacher instructor, and a man from the industry would be called a "foreman instructor." The writer contends that in neither case do they possess the most desirable qualifications.

Trend of Development.

The instructor of a foreman training class, whether he be drawn from the school or from industry, should have had considerable practicable experience with industrial processes and operations. He should be a good teacher, be able to develop a lesson and keep men thinking, and last, but not least, he should be a "live wire." Such a man is hard to find. The man that has put in years of successful duties as a foreman or superintendent and then trained as a teacher by the Department of Education, is the only solution.

The development of vocational training in Canada is just entering its first stages, of which the training of executives and trade experts is receiving attention through the Department of Education, and it will not likely be long before a regular system will be inaugurated for the training of practical men as instructors in their various vocations.

How "Proctor" Saw Tooth Happened

Shape of Tooth Governs Power Consumption and Feed Carried—Reducing Hook and Enlarging Gullet Lessens Sawdust Resistance—How Power Bill Was Cut Down

By A. E. Proctor

There seems to be a great deal of discussion in regard to the tooth I carry on band saws, of which I am in charge. For the benefit of those interested I will give my experience of the development of this style of tooth. I have had an experimental nature all my life and have tried many things in my seventeen years' experience as a filer, many of which I have discarded. A few have been of real benefit to me, of which the tooth I am now using is one. When I first came on the job I now am on, it was a head rig, 10-foot band mill, using 16-inch, 12-gauge, 60 feet long band saws with 3-inch space teeth, travelling 10,600 feet rim travel per minute.

We had some extra hard fir logs and had quite a little trouble with bull heads or goose necks, as some filers prefer to call them, due to high speed. I explained this to the superintendent and got him to slow the mill to 8,500 feet saw travel per minute, which done away with the bull heads, but then my saws dodged the knots at that speed. So I started to let out hook, which helped the dodging and the saws ran better than they ever had before.

Then I commenced to study sawdust resistance and saw that the no-hook tooth had practically none. I commenced to enlarge my gullet and in about a month had teeth down to a depth of 1 7/16 inches. At this depth they commenced to washboard in the cut so I dropped back to 1⅜ inches, which I now have and have had for the past four years.

The sawyer told me that I sure had the right thing as the saws ran much better than with the hook tooth. After getting the long side fixed up with the no-hook tooth, I turned my attention to the short side head rig which is a 9-foot mill on which I run the old head saws, 12-gauge saws, 3-inch space tooth and are worn from 16 inches to about 12½ or 13 inches when put on the short side. This mill is run by a 250 horse-power motor, saw travel of 10,300 per minute. I had the ordinary hook tooth, (see cut No. 1), 13 inches of hook in 16-inch saw, 1⅛ inches deep.

My saws were running as good as the average hook-tooth saw, but the electrician came to me on an average of twice a week and told me that my saws were pulling too hard and that the switch kept bothering him by kicking out every time the saw was in a cut above 30 inches. I told him that the motor was not large enough for the work and that was where his trouble was as other mills of a like size had 350 horse-power motors and did not have this trouble. However, I set to work to see what I could do. I was about ten days changing from tooth like cut one to tooth like cut two. The sawyer immediately told me that the saws cut much easier and that he could carry about one-third more feed.

This ran along for about a month when the electrician came to me and asked what I had done to the saws. In turn I asked why he wanted to know. He said he was not bothered any more by the motor kicking out and that the ammeter showed about a hundred horse-power less being used. Then I told him what I had done. We never have had the motor kick out since that time and have cut much larger logs than before.

Now I will tell you why cut two tooth pulled easier than cut one tooth. No one can dispute the fact that the hook tooth will cut through the timber easier than the no-hook tooth, but you cannot get the proper dust chamber with the hook tooth, therefore, you have sawdust resistance, which consumes much more power than does the scraping cut of the no-hook tooth. Now note that sawdust is forced backwards due to hook into the pocket or gullet and must make nearly a complete turn to release itself. Therefore, it consumes considerable power to force it down and out. There is practically no pocket in cut two back of the point, therefore, no sawdust resistance and as a natural consequence, less power.

Why will tooth two take more feed than tooth one? Because with the less hook you can make a much deeper, larger gullet with no sawdust resistance, which

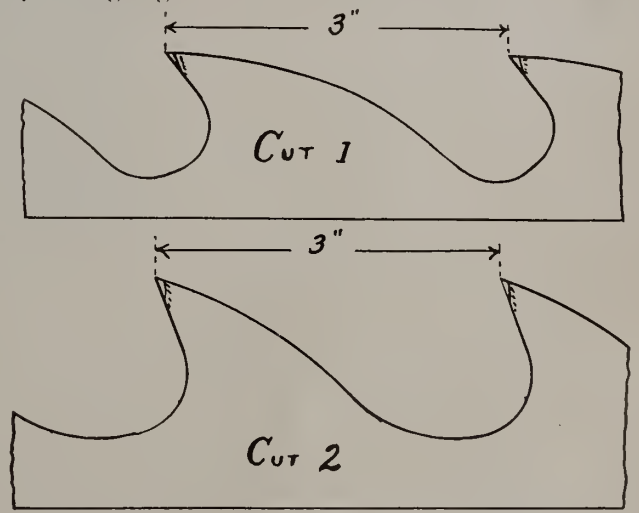


Fig. 1. Hooked tooth. Depth greater than width of gullet. Fig. 2. Less hook, more room for dust and less saw-dust resistance

will carry away a much greater quantity of sawdust per tooth than is possible with tooth like cut one. Therefore, less strain on the blade and it is natural without putting the saw out of line.

Here are a few reasons why all filers should use this style of tooth. First, it has reduced my work by half due to saws, running longer each turn. Second, they have reduced my bench work more than half by tension staying in much longer, due to less sawdust resistance making less strain on the blade. Third, increased feed and better manufactured lumber, with the use of less power and less power means less strain on the saws. Less strain means less bench work, less bench work means longer life for saws. Longer life for saws means longer life for the emery wheel, which means longer life for the filer, due to eating less emery dust, so I consider I have a wonder in the Proctor tooth. While these remarks refer to the larger band-mills the idea is applicable to the smaller saws. The saw filer in charge of the latter machines will have to do a little experimenting and work out his own salvation.—North American Filer.

Progressive Nova Scotia Organization

Piercey Supply Company Erect New Plant—Convenient Layout and Modern, Motor-Driven Equipment—Sawdust Collected and Disposed of Separately—Special Storage for Short Lengths

The new woodworking plant recently completed by the Piercey Supply Co., Limited, Halifax, N. S., is one of the most up-to-date organizations of its kind in the Maritime Provinces. Every effort was made to embody practical and labor-saving features that would tend for greater efficiency, economy and low manufacturing costs. Take, for instance, the way this business is protected against a heavy fire loss.

The fact that a woodworking factory presents many fire hazards is well known to those acquainted with this industry. In this particular instance the buildings themselves are so arranged and planned that, unless in the event of a general conflagration, it is extremely unlikely that more than one or, at the most, two buildings, would be destroyed by a purely local fire. Other precautions include firewalls, shown as double lines in the accompanying plan, sprinkler system, three centrally-located fire hydrants, a 42,000-gallon water-tower and a large reservoir containing 550,000 gallons to supplement the water supply if that should be found inadequate. In view of the above precautions, one would naturally think that this plant is amply protected.

W. D. Piercey, managing director Piercey Supply Co., Limited, Halifax, N. S.

The new plant is located on what is known as the "Cotton factory" site. The yardage facilities consist of about eight acres with four sidings, giving about three-quarters of a mile of trackage, together with storage buildings, stables, sheds, etc. The different warehouses and storage buildings have a total floor space of 150,000 feet. The main building, which houses the machine and cabinet shops, is 150x375 feet, one and two storeys, and is adequately lighted by numerous windows and a large monitor 290x23 feet, which throws light down the center of the building. The machine room in which is installed all the equipment, is heated by the hot blast system, using a Keith fan, manufactured by Sheldon's, Limited, Kitchener, Ont. The benchroom is steam-heated.

Separate Dust Collecting Systems

The usual complement of woodworking equipment, consisting of large and small machinery, is found in the manufacturing department. This is supplemented by an up-to-date filing and grinding room in which is installed the newest automatic equipment. Other departments include a glue-room and paint and finishing department.

Individual dust-collecting systems have been installed to carry off the shavings and sawdust. The shavings are used for fuel and any surplus is stored in a large fire-proof vault, having a capacity of five cars. The sawdust is run into a separate vault, from which it is taken and bagged. It has been found that the local demand for sawdust is in excess of the quantity produced. The idea of keeping the sawdust and shavings separate is in line with the practice followed in the more progressive plants.

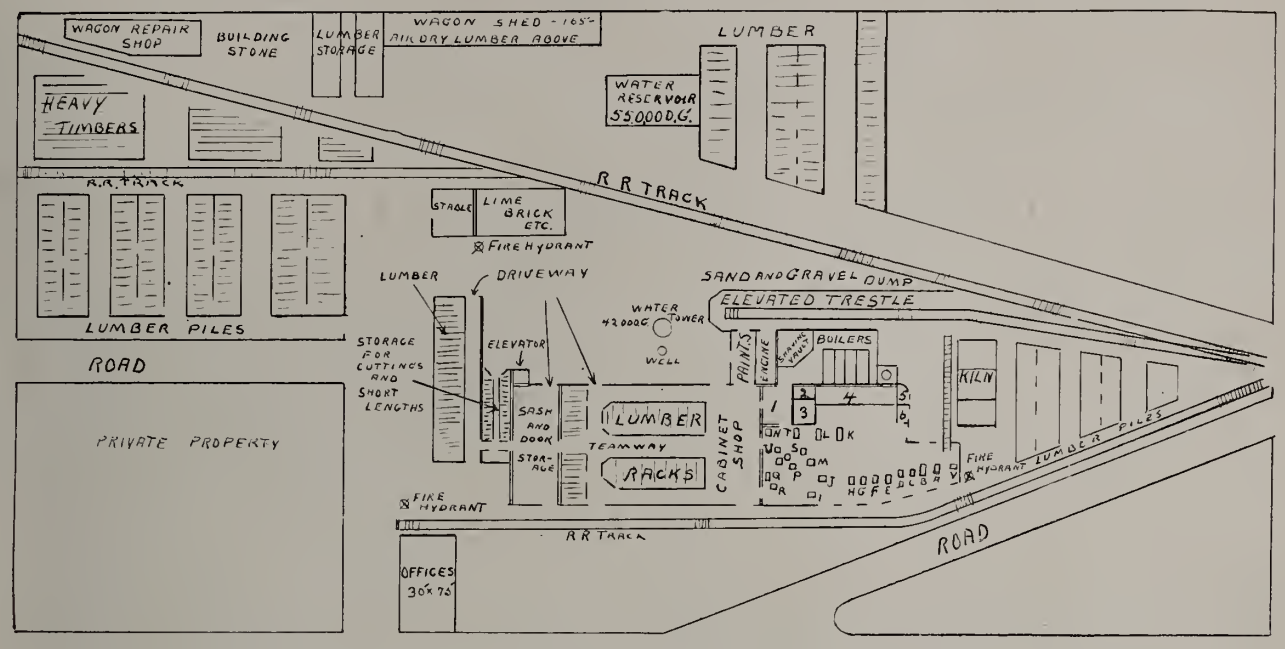
The dry kiln is of the compartment type and is constructed of hollow tile. It is connected with the factory by a track, so that the truck loads of stock may be run into the plant with a minimum of handling. The Piercey Company realize that dry lumber must be kept dry and must be stored under favorable conditions; otherwise the stock will take up moisture from the air, causing trouble and, perhaps, a certain amount of misunderstanding at a later date. To this end all kiln-dried material is stored in dry steam-heated warehouses. Under this system a customer can depend on securing thoroughly dried material. This point is featured on their letter head which bears the caption in red—"Our kiln-dried stocks are stored in steam-heated warehouses. Our customers know the results."

Short Lengths Always Available

The lumber storing buildings are fitted up with racks, which accommodate stock up to 20 feet in length. With such an installation, the stock is always in good shape and may be kept sorted as to lengths and is always get-at-able. One feature worth emulating is the warehouse for short lengths and cuttings. Here all the shorts are sorted and carefully stored away in suitable racks. A customer requiring a short piece of lumber or a few feet of moulding can readily be accommodated; in fact the stock is usually waiting for him. A special storage shed like this enables the short pieces that would otherwise accumulate, and perhaps be wasted, to be disposed of to advantage; to the profit of both the buyer and seller.

The space market "sash and door storage" is a two-storey warehouse with four floors in which is stored doors, sashes, mouldings, etc. One floor 35x120 is devoted exclusively to mouldings, while another floor of equal size contains sash and doors. An electric elevator facilitates the movement of stock in this warehouse.

This plant is fully electrically equipped, all the machines being electric-driven. The power is generated on the premises. The power plant consists of four 200 h.p. boilers, which are used for heating and power purposes. These are fed by the shavings and other refuse from the machine department. This material is conveyed direct to the furnaces by the blower system. A large generator has been installed to produce the current for the motors.



Layout of plant of Piercey Supply Co., Limited, Halifax, N. S., with list of equipment

1. Filing and Grinding Room.
2. Fan Room.
3. Glue Room.
4. Double-deck racks, sash and door stock, etc.
5. Sawdust vault.
6. Storage for binding wood.
A. Double Surfacer.
B. Planer and Matcher
C. Yates Band Rip Saw.
D. Re Saw—Yates.
E. Planer.
F. Yates Moulder No. 108.
G. Yates Moulder No. 108.
H. Buzz Planer.
I. Yates Band Rip Saw.
J. Sash Dovetailer.
K. Swing Cut-off Saw.
L. Turning Lathe.
M. Cabinet Surfacer.
N. Disc Sander.
O. Scroll Band Saw.
P. Sash Relisher.
Q. Sash Sticker.
R. Buzz Planer.
S. Boring Machine.
T. Belt Sander.
U. Chain Saw Morticer.
V. Cut-off Saw.

The personnel of this progressive company is as follows: W. D. Piercey, managing-director; F. A. Nightingale, secretary-treasurer; C. J. Piercey, superintendent; S. M. Zinck, works manager, with Arthur Kidston mechanical foreman.

Fine Cabinet Making in British Columbia

A common idea in the minds of many westerners is that fine cabinet-makers and their products are not to be obtained or found except in the East. This attitude may be due partly to the attitude of the western manufacturer, who, like the modest violet, prefers the quiet seclusion of his commercial retreat to the bustle and competitive strife of a national selling campaign. That British Columbia, at least, need not go outside its own boundaries for its fine cabinet work, show cases, and bank and office fittings, is evident after one has seen the Vancouver plant of Edward Cox, Ltd. Here are to be found examples of craftsmanship that are a credit to B. C. workmen and which, furthermore, compare favorably in price as well as quality with the eastern lines.

Particular attention is given to the finish of these articles and wherever possible native woods are used. Satin walnut, birds-eye maple, quarter cut oak and mahogany are some of the imported woods employed. The workmanship embodied in the products of this firm is in keeping with the high quality of the finished article. In store fittings, as well as in interior fittings of the house, native B. C. fir is used and panels of the same material in three and five ply enters into the manufacture of doors, counter panels and wall-cases. British Columbia cottonwood, in three-ply veneer stock, is used extensively for panels of wallcases, backs of cases and drawer bottoms. Bank, store and office fittings are manufactured of quartered oak satin walnut and mahogany.

At present the firm is engaged in manufacturing gramaphone cabinets in oak, walnut and mahogany and the finish and cabinet work on these articles compare favorably with the cabinets turned out by the phonograph manufacturers themselves. Equipment of the most modern type is used and, with the exception of the veneers, everything is machined and manufactured right in their own factory from the rough lumber to the finished product. A turning lathe, boring and sawing bench, two-wheel emery stand and a bandsaw supplied by Jackson & Cochrane are on the main floor. On the second floor are located a surfacer, a jointer, a bandsaw, a lathe, a ripsaw, crosscut saw, post boring machine, sanding drums and a shaper. Another lathe, a swing cut-off saw, the assembly and finishing rooms are located on this floor also. All glue work is heated in a specially constructed warming box of their own design. The company are making a specialty of fine wax finishes, as this finish is much in demand in all bank and office requirements.

The man who bought second-hand pulleys regardless of the size of his shafting, lost what he saved on the deal by the cost of making special bushes.

A high labor turn-over eats up a considerable amount of money for the new workman must become accustomed to the machine and operation before he can do good work.

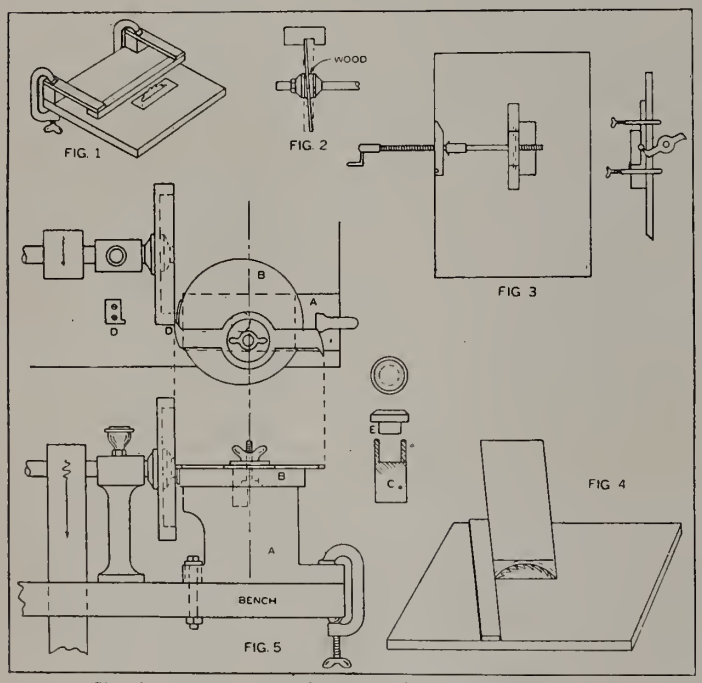
Try These Operations On Your Variety Saw

Writer Says Machine Correctly Named—Can be Used for Many Operations from Shaping Circular Panels to Cutting Threads on Wood Screws for Hand Clamps

By John W. Cake

The uses to which this machine can be put are so numerous that a study of it is usually profitable. The ordinary uses are ripping, cutting-off, mitering and dadoing, but in addition to these are many other things that can be done profitably, not as a makeshift, but in large quantities.

For ripping, cutting-off or mitering we use the ordinary guides that come as regular equipment with the machine. There is, however, another one we use a great deal, known as the overhanging guide, shown in Fig. 1. This guide is made of strips about ¾ x 4-in., braced and clamped to the table so that the work may pass under it, the edge of the guide overhanging the saw even with the outside of cut. If we have a quantity of small doors or drawer bottoms, wide drawer fronts, wide shelves or anything in that class, we make a templet or pattern the exact size and shape wanted. This templet is tacked on the piece to be cut (which has previously been gotten out a little over size), and by running the edge of the templet against the edge of guide every piece will be precisely the size and shape required, and as both ends and both edges are done at one handling, it is very efficient.



Showing how saw may be set up for different operations

Convenient Form of Guide

This guide is also convenient for irregular dadoing and making the fan-tail grooves in sink-drain boards. To do this, the only thing necessary is to lay off on the back of board the direction and distance the grooves are to run, tack a strip on the back at these lines and run strip against guide. This overhanging guide is also used to good advantage in ripping out staves for turned columns, by making a templet the exact size desired, allowing for the entasis or swell. With a smooth-cutting saw a good glue joint can be made, quicker and more satisfactorily than when the staves are run through the molder. After cutting the stave to exact size it can be grooved for spline with the wabble saw, as described farther on. When work is done this way no mistakes occur.

For grooving and tracing moldings we set the guide over the centre of cutter, and for this work we use the "Linehan" cutterheads, which are a great convenience when used on a cabinet saw arbor. For cutting in hinges on boxes or chests, these cutters cut perfectly, so that no trimming or handwork is necessary.

For dadoing grating or shelves in cabinet work the best method we have found is to make a strip the same thickness as stuff to be dadoed, by about 1-in. wide, cut dadoes in one edge of this strip exactly as wanted in the work, nail a block on cut-off guide just the size of dado and precisely over the cutter and tack this strip on edge of work, letting notches come in block on guide. One or both sides of stuff can be dadoed by this method and all shelves will line up perfectly. When grating is dadoed this way we do it in such widths as we find, afterward ripping the bars to width. It is well to make a mark in the bottom of end dado, so that when putting it together all ends come the same way, so that alignment may be perfect.

Grooving With Wabble Saw.

Not every small mill has a set of dado cutters, many depending on a wabbling saw for this work. A very clean and accurate dado may be made if the saw is in good order. For best results lay off on a board the size dado to be cut, and the size and thickness of saw used, and the angle of block will be readily found. Bore a hole in this block the size of saw arbor, cut the block with band saw on the angle so found, place one part of block on the arbor, the saw next and the other part of block next, then the collar and nut. The saw will then wabble so that the groove will be just the right size and very smooth and true. Fig. 2 shows more plainly how this is done.

Recently we had a lot of handscrews to make and did the job in the following manner: We took an inside cutter of a "Huther" dado head, ground it to fit the screw thread, and put it on the arbor in the usual way. We then turned the screw blanks in the lathe, leaving the handle 1-in. longer than necessary. In the end of this handle we bored a hole the size of the end on screw, about ½-in. deep, then bored a ⅛-in. hole through both handle end and screw end and pinned them together with a split cotterpin. We clamped a jaw with thread in it on saw table, clamped a block on table, with hole in it directly over cutter, put a crank on the old screw, and, by turning this old screw, the screw to be cut revolved in hole over the cutter and made a screw as perfect as can be cut by any method, and very quickly. Fig. 3 shows this method.

Shaping Circular Panel.

We often have circular panels to make, and these we do partly with the cabinet saw and partly on the jointer; of course, if we had a great many of same size to do, we would run them on the molder, but with a few of each radius the cabinet saw is quickest. We clamp a board on saw table, at such angle with the saw that the cut will be proper width and depth, and push the panels across the saw several times until cut

is complete. Fig. 4 shows this method. It is a little slow, but is quicker than can be done by grinding molder cutters to proper circle.

We have several sets of Huther dado cutters and find it rather hard to keep them all true to size, as we use the two outside cutters on all dado work, while some of the inside cutters are very seldom used. We designed a jig for grinding them true, which does the work very accurately and quickly. A cup-face wheel is best for the purpose, but any other may be used. Fig. 5 shows a plan and elevation of this jig. A is a hardwood block about 4-in. thick and wide enough to extend from bench to within 1-in. of centre of wheel; it can be moved to or from the wheel to accommodate any size cutter. B is a disc 1-in. thick and about ½-in. smaller than diameter of cutter to be ground. Through this disc two holes are bored, one in centre, to fit pin C, and one ½-in. hole about 1¼-in. from centre, recessed out on under side to accommodate head of bolt. On this bolt is a true concentric bushing to fit the hole in cutter.

Grinding Dado Cutters

To grind, the cutters are placed on the disc and clamped tightly with thumbnut, the throat of cutter being tight against guide D. The disc is then turned just far enough to grind one end of cutter, the thumbnut loosened and the other end of cutter brought against guide-pin. When grinding the outside cutters, each tooth must be brought against guide-pin D. C shows the centre-pin in detail section. It has a hole drilled in centre, about ½-in. In this hole is inserted plug E, with head the size of hole in cutter. After grinding the cleaner teeth of the outside cutters, we put them on the plug, set block. A back so that face of wheel is about 1/64-in. from point of cleaner teeth, and in that position revolve the saw slowly. In this way the spur teeth are struck exactly right, but we afterward file them with a hand file.

If the saw arbor is not long enough to get all the cutters on without falling into the threads, order them with hole about ⅛-in. larger than arbor, and have a set of bushings made to fit arbor and saw, and your dado cutters will always cut true if they are ground right. About five bushings will do—one each, 3/16, ¼, ⅜, ½ and ¾-in. long.—"The Woodworker," Indianapolis.

Drying Lumber with Superheated Steam

A kiln-drying process which will dry 1-inch softwood lumber green from the saw to 10 per cent. moisture content in 24 hours or less has been developed at the U. S. Forest Products Laboratory, Madison, Wisconsin. The novel feature of the process consists in forcing superheated steam at high velocity first in one direction and then in the opposite through the pile of lumber in the kiln. This treatment dries the lumber very uniformly and rapidly with a minimum of checking and warping.

The superheated steam process has been found applicable to Douglas fir, firs of all kinds, western hemlock (not eastern), white cedars (not western red), sugar pine, western yellow pine, and southern yellow pine. It is entirely unsuited for some softwoods on account of collapse.

Drying lumber by this process consumes more steam per thousand feet of lumber than ordinary kiln-drying processes, and is recommended only where economy in fuel is not essential. As it is deleterious for lumber to be exposed for more than two or three days to the temperatures used, the superheated steam kiln is not adapted to the drying of lumber in thicknesses of more than 2 or possibly 2½ inches. It should be stated, furthermore, that the treatment somewhat reduces the toughness of the lumber, so that where this quality is of prime consideration, as in airplanes and waggons, a low temperature process of drying should be used. On the other hand, the superheated steam method reduces the "working" of the board and the hygroscopicity of the wood and also "fixes" the resin and gum. The effect upon knots as compared with low temperature drying has not been fully determined, but apparently there is not much difference. A slight darkening of the sapwood occurs, increasing with the length of time of exposure, and in periods much over 24 hours the heartwood may darken also.

Owen Sound Baseball Champions

The city league championship of Owen Sound, Ont., was won by the baseball team of the North American Furniture Co., Limited. For the last few years this company have endeavored to foster a feeling of good fellowship and good sportsmanship amongst their employees and the management is gratified that their team was so successful. The idea is a good one. If employers were to take a greater interest in the sports and recreations of those in their employ, it should tend to strengthen the bond between management and labor and tend to allay the unrest that is all too prevalent.

Baseball team of the North American Furniture Co., Limited Owen Sound, Ont.

The picture shows the various members of the team and officers as follows: Back row: A. S. Muller, New York, patron; F. W. Harris, vice-president; J. A. Mincher, president; Joe Ramsay, 1st base; Geo. Foote, hon. vice-president; Edw. Irving, sec.-treas.; M. Tousley, executive; R. S. Brown, executive. Second row: J. Calcutt, c.f.; R. Flannigan, r.f.; E. Tuckwood, lf.; R. Miller, 3rd b.; W. Vance, pitcher. Front row: A. Levi, f.; L. McDonald, catcher and captain; Roy Taylor, mascot; Fred Foote, short-stop and manager; E. Jarvis, 2nd base.

A good hook on a saw tooth lessens the amount of power required to drive that blade.

High speed steel cutters are little better than carbon steel, unless they have been properly ground and tempered.

Record Attendance at Cooperage Gathering

Publicity Work and Mill Inspection Discussed—How Mold May be Overcome—Air Drying Worthy of More Attention

The fifth semi-annual gathering of the Associated Cooperage Industries of America, held recently in Cleveland, brought out a large number of coopers, the total attendance equalling, if not exceeding, the record set at the St. Louis convention last year. The reason for this gratifying showing seems to be that each member came out to hear what the others had to say about the industry in general and the probable trend of the market in particular.

One branch of the association activity that is receiving considerable attention is the Mill Inspection Service. This has for its prime object the production of a uniformly high grade of cooperage stock. Better stock means better barrels. In speaking of this phase of the work, Secretary Krafft has this to say: "It is recognized that inferior material has adversely affected the prestige of the barrel as the 'king' of all containers. It is also recognized that the fundamental requirement for the real development of the cooperage industry is better cooperage. It will, therefore, be seen that a service which makes for better material is bound to have a beneficial effect upon the industry.

Inspection Service Valuable.

"We are making every effort to perfect this service and make it as efficient as possible. In order that mill owners may be fully advised of the inspection of their mills, we will hereafter arrange to provide them with inspection report, which will show conditions as found by the inspector. In this connection it is confidently anticipated that the inevitable result of our mill inspection service will be the material lessening of the necessity for reinspections at delivery points. Since the inauguration of this service as an association activity, our inspectors have made 169 mill inspections and 86 cars have been inspected at delivery points on account of complaint or rejection."

The slack cooperage group meeting brought out about 100 members. During the past year about $40,000 has been spent on advertising, booklets, etc. This publicity work has been carried out in the face of great difficulties; in fact, the slack cooperage industry was up against a serious proposition. Barrels sold at high figures while due to a break in the cotton market, bags are away down. The publicity and trade extension work should be pushed aggressively.

At the tight coopers' group meeting, advertising was the chief topic for discussion. The publicity work of the past year was outlined and plans made for extending the campaign during the coming season. The tight coopers had experienced a good year but were awaiting with interest the decision on the manufacture of cider. Cider manufacturers are large buyers of tight stock.

Air Drying Staves.

Secretary Krafft read suggestions offered by the inspection department on the construction of stave sheds and the method of piling. The suggestions follow:—

Our inspectors have directed attention to the lack of uniformity in the construction of stave sheds and the manner of piling staves for drying. In many instances they find staves piled without any regard to the necessity of securing adequate ventilation, and while it is, of course, understood that the presence of mildew and mold is largely due to atmospheric conditions, experience has shown that proper ventilation will, to a large degree, minimize this "bugbear" of slack stave manufacturers.

In the first place it is obviously necessary that stave sheds be properly constructed. It is suggested that sheds be built as near north-and-south as possible in order to secure the benefit of a maximum amount of sunshine; also that the sheds not exceed 16 ft. in width. The piling of staves flush to the ground, or with but little space between the ground and the floor, or lower tier, results in insufficient ventilation at the bottom of the piles; unless the moisture from the ground can be carried away by a circulation of air it will aggravate the mildew and mold. It is therefore recommended that staves should be piled at least 20 in. from the ground, and accordingly posts should be placed in the ground just high enough to permit the truck's axles to pass, then timbers can be laid on top of the posts—not spiked, however, but so that they can be shoved aside and not hinder the movement of the trucks—or else cull blocks can be used in lieu of posts, letting pilers and boosters move these as needed. It is, of course, desirable to have the sheds constructed on as high ground as possible.

Reducing Trouble From Mold.

Another important feature of the construction of sheds that is apparently overlooked is provision for adequate ventilation through the roof or top of shed. This could easily be provided for by a cupola or vent such as is commonly seen on farm stock buildings. The rafters could go to the peak and 2 x 4 upright pieces on every rafter to hold up the top. It is found that staves are often piled too closely. It is suggested that, particularly during the moldy season, staves should be stacked not closer than 20 in to 2 ft. It is found that in many instances staves are stacked from 9 to 15 in. apart. Furthermore, for all practical purposes it is suggested that the wide staves be in the centre of the pile; this will prevent their flattening out.

During the spring of the year timber naturally contains a maximum amount of sap and it would therefore seem advisable that during the moldy season the staves be thoroughly steamed in order that as much sap as possible be driven out in the steaming process. As a matter of fact, properly steamed timber is at all times essential for the manufacture of good staves.

As stated, it is not to be understood that these suggestions will entirely prevent the accumulation of mildew and mold, and it is recognized that the construction of sheds and piling of staves in accordance with the above suggestions would be more expensive than the method generally followed. However, when it is considered that during the moldy season probably at least 25 per cent. of staves are disqualified from being graded as high-grade staves solely on account of the mildew and mold, the ultimate economy in using every precaution to minimize the mildew and mold will be clearly seen.

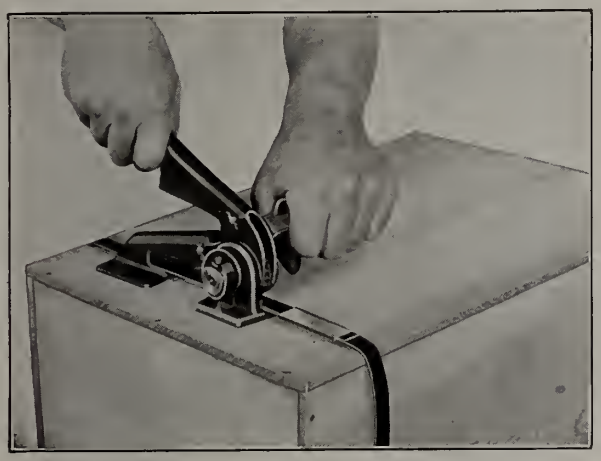
How Price of Boxes May be Reduced

Box Manufacturers Can Reduce Cost of Their Product and Render Distinct Service to Customers by Suggesting Lighter Boxes Reinforced with Tensional Binders

By R. D. Livingstone

All box manufacturers and most shippers are familiar with the use of metal straps as a means of strengthening cases and crates. Up to within comparatively recent years the accepted method was to nail a strap to each end of the box, the assumption being that maximum use was being made of the strength of the strap thus applied.

A study of box construction, however, and careful analysis of the strains to which a box is subjected



Stretching tool for tightening tensional binders

in transit, suggested that another method of applying reinforcing straps would give far greater returns for the metal and labor expended per box.

This latter form of reinforcement is commonly known as "tensional box binders" or "nail-less box strapping," and consists of encircling the cast with the metal strap (from three to five inches from ends), drawing same very tight by means of a stretching tool (Fig. 1), and interlocking the overlapping ends within a metal sleeve in such a manner that the joint has a tensile strength approximating the strap itself. This is accomplished by means of a sealing or crimping tool (Fig. 2). When tools are removed the strap remains, hugging the box under high tension, so that strains or blows are transferred to and absorbed by the steel band, and do not cause loosening of the box nails.

Effects Saving in Box Lumber.

The fact that a tensional binder can be applied to the box in from one-third to one-fifth of the time required to nail a strap on was sufficient reason to insure its immediate popularity with shippers; but by far the greatest benefit derived from its use—by the public, box manufacturers and shippers alike—is the enormous saving in box lumber effected.

Exhaustive tests have been made both by the U. S. Forest Products Laboratories at Madison, Wisconsin, and by large individual shippers, to ascertain the amount of reinforcement afforded by tensional binders, and the results of these tests are indeed remarkable. It has been shown that a given degree of box strength can be more cheaply obtained by the use of wood, nails and tensional binders than by the use of wood and nails alone. In other words, by reducing the thickness of the box shook, and adding one or more tensional binders, a stronger container can be had at a lesser cost. Such binders permit the use of boxes made of thinner lumber, because the tightened straps, set in several inches from the ends of the box, act in precisely the same manner as hoops on a barrel—the bursting strain thus being entirely removed from the nailed ends of the box.

Illustrating Saving Possible.

As a concrete example of the possibilities of nailless box strapping as a money-saver, the following quotation from an unsolicited letter to a manufacturer of this commodity is given: "We formerly used for the shipment of our products boxes with sides, tops and bottoms made from ¾-inch. lumber. Since using nailless strapping, we have found that lumber ⅜-inch thick is heavy enough."

The strapped box of ⅜-inch lumber referred to (including cost of applying strap) cost the writer of above letter 50c less than the unstrapped box he had formerly used.

An interesting laboratory test was recently made on a standard screw and bolt box containing 250 pounds of screws, packed in bulk. This box had ⅞-inch lumber throughout with 3 x ⅞-inch cleats on

Sealing or crimping tool for fastening lap

the ends to form what is known in the box-making trade as a "Style 4" box. This box (unstrapped) was dropped four times from a height of 12 inches when it failed, as shown in Figure 3.

Another box was made with sides, top and bottom of ¼ inch lumber, ends ⅞ inch and 2 x ⅞ inch cleats, known as "Style 2." This box, with same contents as

the first, reinforced with three 5/8 x .015 nailless straps, was dropped on diagonally opposite corners from a height of 12 inches, and failed on the fifty-fifth drop. Figure 4 shows this box after having withstood forty drops. The saving in this instance—including cost of applying straps—figuring lumber at $50.00 per M. base, is over 17½c per box, while the increase in strength of the ¼ in. strapped box over the 7/8 in. unstrapped box is 1375 per cent. The saving in freight on this container is over 40 per cent.

With freight rates increasing and box lumber not decreasing in cost, the attention of the box manufacturer should be focused on this subject,—not alone in the interest of lumber conservation—though this is all-important—but in the interest of his customer as well. The alert box salesman by suggesting to his prospect a lighter and cheaper container, reinforced with binders, can and frequently does, secure not only the order, but also his customer's gratitude for the service rendered.

Applicable to Green Stock.

It should, perhaps, be remarked that where green lumber is used in boxes, the reinforcing value of the binder is increased as the thickness of the shook is reduced. The reason for this is that the lighter lumber—such as 3/8 and ¼—more readily permits the sides, top and bottom being drawn in by the strap until the circumference at each strap is considerably less than the circumference at the ends of the box. This makes it impossible for the strap to come off the box, even in case of excessive lumber shrinkage.

While the purpose of this article is primarily to invite the box manufacturer's attention and study of tensional binders as a means of conserving lumber, the versatility of nailless strapping will occur to anyone giving the subject any thought. As a medium of reducing thefts in transit it probably has no equal, and this of course is an added advantage to manufacturers whose products particularly appeal to car thieves and pilferers.

Shippers who have heretofore regarded box strapping as an added and unnecessary expense, are fast recognizing the value of the nailless method as a real money saver, while in many instances railroad classification committees have granted preferential rates on containers thus reinforced.

A Pathetic Wail

Upon receipt of a collection letter, asking for cheque to cover his account, one business man replied as follows:—

Sir,—For the following reasons I am unable to send you the cheque asked for:

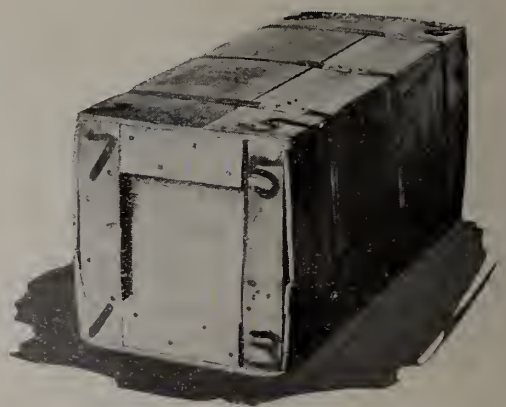
I have been held up, held down, sandbagged, walked on, sat on, flattened out and squeezed, first by the Canadian Government for Federal War Tax, Excess Profits Tax, Merchants License and Auto Tax, Victory Loan Bonds, Thrift, Capital Stock Tax, and every society and organization that the inventive mind of man can invent to extract what I may or may not possess.

From the Society of John the Baptist, the G. W. V., the Women's Relief, the Navy League, the Red Cross, the Purple Cross, the Black Cross, the Double Cross, the Children's Home, the Dorcas Society, the Y. M. C. A., the Y. W. C. A., the Boy Scouts, the Jewish Relief, the Belgian Relief, and every hospital in town.

The Government has so governed my business that I don't know who owns it. I am inspected, suspected, examined, re-examined, informed, required and commanded, so I don't know who I am, where I am, and why I am here, all I know is I am supposed to be an inexhaustible supply of money for every known need of the human race, and because I will not sell all I have and go out and beg, borrow or steal money to give away, I have been cussed, discussed, boycotted, talked to, talked about, held up, robbed and nearly ruined, and the only reason I am clinging to life is to see what in Hell is coming next.

Much of the waste found around woodworking plants can be converted into toys, but it requires special machines and special attachments to work this material up with a minimum of labor so that a fair margin of profit may be made.

Showing failure under test after being dropped four times



Box reinforced with nailless strapping after forty-fourth fall

Standardization of Canned Foods Cases

Address by Don. L. Quinn, Research Department, Chicago Mill & Lumber Co., Chicago, Ill., Delivered at the Annual Convention of the Iowa-Nebraska Canners' Association, Cedar Rapids, Iowa, November, 1920

The National Association of Box Manufacturers to whom your invitation was issued, wishes to express its appreciation of this opportunity of telling you something of its efforts to secure standards of construction for wooden boxes, especially as they apply to standardized cases for carrying canned goods.

The management asked me to deliver this message to you. They selected me, no doubt, because I have been identified with all the tests and the studies, and because I have participated in all the negotiations on these standard specifications since the project started.

Don. L. Quinn, Chicago, Ill.

First of all, I desire to refer to the National Association of Box Manufacturers and tell you why it has been so active in this work. This association is national in its scope and includes in its membership practically all the leading manufacturers of wooden boxes. Many of its members manufacture other types or kinds of packages, such as solid fibre, corrugated, wirebound, hinge-corner, etc., but the association itself confines its activities to the wooden box interests.

It is the largest, as well as the oldest, among the box associations, and has ever been a strong influence for progress in the industry. It believes, as a fundamental principle, that standardization of packing boxes, when based on scientific research studies, will not only stabilize the business of its members, but will result in both cheaper and better boxes for their customers.

The Forest Service of the Federal Government is authority for the statement that we are using up our timber resources at least four times as fast as they are being reproduced. This situation calls for new and more effective conservation measures. About six billion feet of lumber (nearly 15 per cent. of the total annual cut) goes into boxes and crates.

Those of us who are familiar with the economies which have resulted from redesigning boxes along scientific lines—this includes the leading box manufacturers of the country, leading engineers in Forest Products, as well as many of the packing experts in industrial plants—believe, as a result of what has already been accomplished, that at least 25 per cent. of the material now used in boxes and crates can be censored without any loss of efficiency in the packages themselves.

If this estimate be correct, then at least 4 per cent. of the annual cut of lumber, or nearly one and one-half billion feet, is wasted. This one and one-half billion feet, made up in boxes or crates, costs the ultimate buyer, at the present average price, more than 125 million dollars annually. To this waste we can justly add the many millions of dollars paid in loss and damage claims due to insecure packing-boxes failing to carry their loads safely to destination. The National Association of Box Manufacturers believe that in the elimination of this enormous waste there lies an opportunity for it to render a service that cannot be performed so well by any other organization, and that it is a true conservation measure.

Canned foods cases received its earliest and continued attention because such cases were not giving the service in transportation interests, who, because of lack of knowledge, threatened unknowingly, of course, to saddle onto the industry enormous increases in costs, without those compensating advantages which any such increases should always carry. The National Association of Box Manufacturers has looked after the interest of those canners who wish to continue using wooden cases, and in guarding the interests of the customer, it has also guarded that of its members, as the following recital of its activities will show.

In February, 1914, a conference was held in Baltimore, Md., between committee of the National Canners' Association, the National Wholesale Canners' Association and the Transportation Companies, together with some individual box manufacturers, regarding better boxes for carrying canned foods. Specifications calling for 5/8" ends, and 3/8" sides, top and bottom were tentatively agreed upon.

These tentative standards were opposed by the National Association of Box Manufacturers, because it believed the standards so provided would not, in themselves, give the transportation companies the measure of service they were expecting and had a right to expect; that they did not combine practicability and economy to the best advantage, hence would conserve neither the best interest of the box manufacturers nor of the canner. The box manufacturers promised, however, if given time, to have a thorough and comprehensive study of canned food case construction made in the United States Forest Products Laboratory at Madison, and as a result of that study present specifications which would combine practicability, serviceability and economy in their

proper balance. Thereupon began a series of tests in the laboratory, and studies in the field, followed by the promulgation of tentative standards somewhat similar to those finally adopted. Next came conference and negotiations between box makers, canners, box associations, the canners' association, the wholesale grocers' association, transportation interests, and the like, extending during the war to the War Department and the Food Administration. This work has continued even to the present time. Out of it all has come almost a unanimous agreement on every detail of the specifications, for it was demonstrated over and over again, that boxes, made according to those specifications, have the proper measure of serviceability; are practical to manufacture everywhere; and are, on an average, more economical than those now in common use.

In 1915 a joint committee representing the National Canners' Association, the National Wholesale Grocers' Association, and the National Association of Box Manufacturers, after many conferences, reached an agreement on standard specifications for cases to carry No. 2, No. 2½, and No. 3 cans, which specifications were officially adopted by each of the three associations at their next annual conventions. Early in 1916, the three associations jointly petitioned the various railroad classification committees, to incorporate these standards in the railroad classifications, but, because these standards covered only the cases for No. 2, No. 2½ and No. 3 cans, and not all foods, the railroads declined to act.

During the World War, the United States Food Administration and the Quartermaster Corps of the War Department applied these specifications, which, by the way, had by then been extended to cover all canned foods, to boxes for carrying subsistence stores in both domestic and export shipping. In that severe service, their entire practicability was demonstrated. Those of us who were in the midst of the packing problems during the war, know that if it had not been for those tests, studies and resulting specifications, and the fact that the box manufacturers were standing guard, both the Food Administration, and the War Department would have demanded stronger, heavier and more expensive cases than were used, and no better service would have resulted.

Following the war, the United States Railroad Administration appointed a committee of railroad men to study ways and means of reducing the rapidly mounting loss and damage claims. Among its activities, it drafted standard specifications for canned foods cases, which it docketed for a hearing before the Consolidated Classification Committee. This hearing was held in May, 1920. These specifications were drawn up without regard for the valuable knowledge and information gained during the past five or six years, and, as was to be expected, drew the fire of everyone interested. The specifications could not withstand the volley of criticisms aimed at them, so were withdrawn.

The National Association of Box Manufacturers then filed with the Consolidated Classification Committee, revised specifications for canned foods cases, which would apply to all cases carrying canned foods, instead of No. 2, No. 2½ and No. 3 cans only, and advocated their adoption. These new specifications combine the best that resulted from the laboratory studies, the many years of experience of practical box men, and the tests of actual service in carrying war stores. It is our understanding that these new specifications will be redocketed for an early hearing before the Consolidated Classification Committee, and we are quite confident they will be adopted.

Will Building Activities Start in Spring?

Well Known Builder Outlines His Views— Lower Costs Not Anticipated

The public is not going to buy houses one whit cheaper in the spring, and building activity will recommence with a bang, according to S. B. Green, who points out the incalculable harm the present rumors of lower prices in the spring are going to have in further accentuating the number of people who will be living in cramped and unhappy conditions. "I offer my opinion as a builder in Toronto who completes from 30 to 60 houses a year and who is acquainted with building in general throughout Canada and the United States," said Mr. Green. The rumor that there is no money for loans is absolutely false, he declares. "There is more private money for acceptable loans on houses now than at any time in the past year, with conditions getting brighter."

Mr. Green believes that he can say with absolute safety that there will be no drop in the wages of skilled business mechanics, and that the prices of building materials show no trace of a revision downwards. On the contrary, he feels that in many items there may be a slight rise very soon. "I frankly admit that, in some retail lumber yards spruce and jack pine can be bought for practically wholesale prices. What we have seen lately in the clothing market, is true of many local lumber yards. They are overstocked, and are forced, because of the temporary absence of building, to turn their stock into money. But I submit that 'he who runs can read the signs.' No merchant can buy and sell at the same price. Their overhead must be met, and there must be a profit. Prices will advance the moment their stock has reached the point where buying is necessary. Doors and sashes and various kinds of mill work are also slightly lower now because mill owners find it necessary to keep their mills going and retain their better men, even if, for the present, the cost equals the selling price.

As a result of this waiting policy there will be a greater shortage in all kinds of building materials and houses, says Mr. Green. "As to brick, especially the finer grades, there is not one per cent. of a decline and none in sight, because the labor used here is specialized to a degree. The price of coal which is one of the biggest factors in the manufacture of brick to-day, also shows no trace of becoming cheaper. Cement, lime, and sand, too, show no decrease. Heating, both hot air and hot water, instead of showing any decline, continue to advance."

The average home builder would far rather borrow his money from loan companies than from governmental housing commissions, says Mr. Green, because of the delays and restrictions that are always connected with governmental departments. "It has been my experience, that, no matter how tight the money markets, there are some good sources never closed, and never more than 7 per cent."

The workman is defended by this big builder against the common attacks from people who do not employ him. "He is turning out just as honest a day's work as he ever did, quality and quantity jointly considered."

Machinery & Equipment

New Electric Ball Bearing Moulder

To satisfy the growing demand for a real, high-powered, flexible, heavy duty moulder of greatest production capacity, the Mattison Machine Works, Rockford, Illinois, U. S. A., have developed a completely motor-driven machine. It was designed and built from the ground up to overcome the limitations of the belt-driven sticker.

One of the main features of this new machine is its complete electric drive. Individual, built-in motors drive the ball-bearing spindles which carry the cutter-heads. The feedworks are also driven by an individual motor.

As the illustration shows, this moulder is of heavy, rigid construction throughout; yet it is very easily accessible for quick setups. The side heads are adjustable vertically, as well as in and out, and may be tilted to forty-five degrees. This, together with many other improved features, provides a flexibility which constitutes a very desirable feature in any moulder. Circulars and full information may be secured by writing the makers, the Mattison Machine Works, Rockford, Ill.

Ball Bearing Shaper Collars

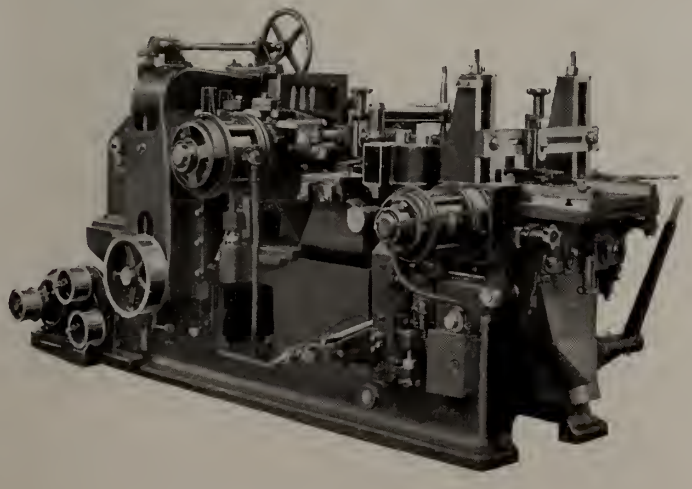
An attachment for shapers that should be found very handy in any woodworking plant, is the ball bearing shaper guide collar, which is being placed on the market by the Woodworkers' Tool Works, Chicago, Ill. This ball bearing guide collar is designed to eliminate the friction set up by the stock being held against the ordinary type of solid collar. It tends to save the patterns, increasing the capacity of the machine, reduce spoilage and helps cut down the power bill. In operation the cutter shell is free from the slotted collar proper and ceases to revolve when the pattern or stock touches it. This type of guide collar has this advantage over any form of stationary guide, and that is that it rolls with the work and, therefore, does not interfere with the free movement of the work past the cutter. The ball bearing type may be had with either grooved or solid ball-bearing collars. Full particulars may be had from the Woodworkers' Tool Works, Department A, Chicago, Ill.

Close Joint Drum Sander

A new close-joint sanding drum is shown in the accompanying illustration. In this machine a very close joint is possible. This results in greater service being secured from the sand-paper as the tendency to

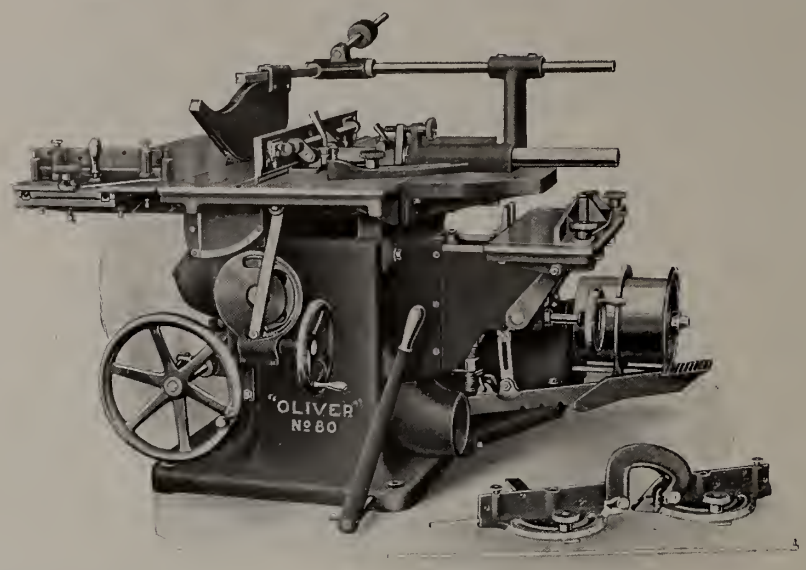
Note close joint where paper meets

slip or break away at the joint is eliminated. The paper and carpet are fastened in a very simple manner and the sand-paper can be changed in five minutes. The drum is constructed from a single casting and turned to a perfect running balance. Owing to the method of attaching the sand-paper, it is stretched tightly, insuring a smooth, even-running drum. A glance at the illustration will show how close a joint it



Mattison ball-bearing electric moulder

Efficient ball-bearing shaper guide collar

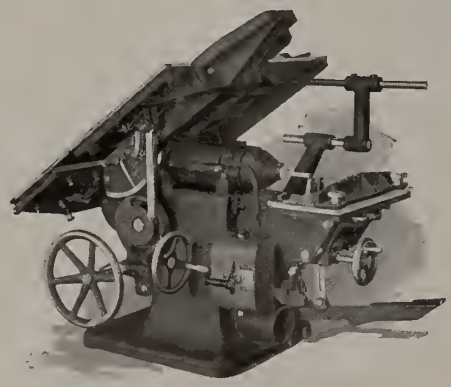


The New "Oliver No. 80"

is possible to make on this machine. Circulars and full particulars may be had from the Wm. Loeffler Machine Co., Sheboygan, Wis.

Efficient, New Type Variety Saw

The accompanying illustrations show two views of the new No. 80 Oliver variety saw, which is being placed on the market by the Oliver Machinery Co. of Grand Rapids, Mich. This machine is designed for



Oliver No. 80, showing built-in motor

either belt or motor drive. When equipped for electric drive, two installations are applicable. Where a two or three-phase, 60 cycle alternating current is obtainable, a compact motor on arbor can be installed by mounting the motor directly on the saw arbor in place of the ordinary pulley. The other installation consists of mounting a 5 h.p. motor on a sub-base bolted securely to the frame of the machine. When the mounted-on motor is used, the rotor of the saw-arbor and the rotor of the motor are one and the same. The rotor is mounted in ball bearings so that practically all the power is transmitted to the cutting edge of the saw. In the belt-drive machine a roller bearing countershaft is supplied, thus reducing the power consumption to a minimum. The saw-table is 36x44 and tilts to 45 degrees to the left. It has a vertical adjustment and may be had either plain or universal. The universal type is shown in the accompanying illustrations. One part of this table, 15″ wide, is called the "rolling section." This is located at the left of the saw and rolls on ball-bearing ways which have a vertical adjustment for alignment and wear. The table may be moved several inches from the saw, permitting the use of a dado or special cutter-heads. This machine will rip up 23″ wide and as a cut-off saw, has a capacity of 32″ wide. A mortiser and boring attachment can also be secured, which would bore holes 6″ deep and up to 2″ in diameter and mortise holes ¾″ square and 4″ deep. This variety saw is designed and built strictly up to the most modern demands of the woodworking industry and is adaptable to a wide variety of uses and operations. A circular and full particulars may be secured from the Oliver Machinery Co., Grand Rapids, Mich.

Maintaining Authority of Foreman

The decisions of the foreman must be upheld by the management, or failure to command respect will result. If the management appreciates the importance of the duties, both official and unofficial, which are attached to the appointment of a foreman, it will take pains to observe the men, their methods and habits, and will not appoint a man foreman unless they have every factor carefully weighed, as a bad Having decided on their man, the factory heads must Havin gdecided on their man, the factory heads must place no restrictions on him within his appointed field and must be prepared to give his authority all the backing wtihin their power. In this way only can success be achieved by the man of their choice.—"Ways and Means."

The big increase in wages make poor belts a very doubtful proposition.

The electric motor when coupled direct to the spindle saves the belt.

Why waste a lot of labor screwing in screws when they can be driven automatically, with a big increase in production ?

Upholstering and Trimming

Upholstered Furniture Men Meet

Enthusiastic Gathering at West Baden—Conditions in Industry Discussed—Manufacturing Costs Do Not Warrant Price Reductions

The twenty-second general meeting of the National Association of Upholstered Furniture Manufacturers was recently held at West Baden, Ind. About fifty members were in attendance.

The president, A. D. Gorrell, in his address, dwelt on the necessity of sane price reductions, based on lowered manufacturing costs, as radical reductions were bound to have an adverse effect on the whole industry. He said, in part: "When prices of raw material have been reduced to a point where the increased overhead does not absorb them, it is only right that prices should come down in proportion. No one expects that the present price scale is permanent, yet we want to warn against radical reductions at this time when manufacturing costs absolutely forbid them. We know of some small manufacturers who are actually offering goods below cost, and we want to warn them that this proceedure will put them out of business in the end."

The general opinion of those present was that prices should remain at about the present level until there are real reductions in coverings and other similar materials.

D. D. Fennell, director of industrial relations, touched on the work of his department. The members showed a lively interest in this particular field and plied Mr. Fennell with questions. This questioning brought out the fact that according to the best information available, only a little in excess of 40 per cent. of the men previously employed are now at work in the upholstering industry. If all of the upholstery factories were to use their present equipment to capacity, there would be an over-production to-day of at least 25 per cent. Practically 100 per cent. of the membership in the Upholsterers' Association have open shops. The forty-eight hour week has been determined upon as ideal by the association, although the character of the work is such that a fifty-five hour week would not develop harmful fatigue. The last demand made by the mattress makers in New York City was for a forty-hour week, $65 minimum weekly wage and fifty-two continuous weeks, paying straight time for holidays—if they did not work—and if they did, double time, and double time for overtime. These demands were rejected by the manufacturers.

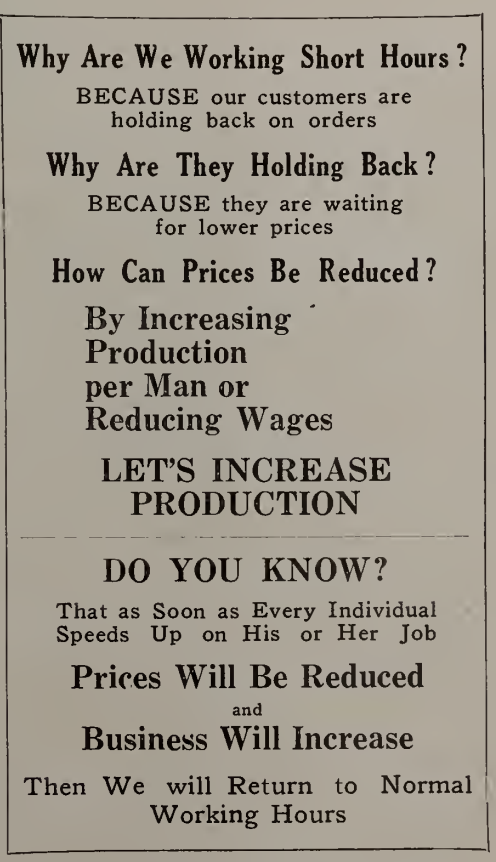
The cancellation of orders was cussed and discussed the question being tackled from every angle. It was decided that some form of uniform contract or order form that would bind the manufacturer to make delivery of the goods at a stated time and at a fixed price while the retailer would be bound over to accept the goods, should be adopted. A contract of this kind would not be subject to cancellation unless mutually agreed upon by both parties. The executive committee were empowered to draw up such a form.

The advisability of guaranteeing prices against a decline was also discussed. No decision was reached on this subject, it being left to the initiative of each individual. In all probability many of those present will guarantee that there will be no reductions in their lines until July 1, 1921, if at all.

Frank J. Seng, of The Seng Company, Chicago, gave a brief talk. He touched on industrial relations in his plant as follows: "When the slump in demand came, we were forced to cut hours to labor and to let some men go. We tried, first, cutting to thirty hours per week and keeping a rather full force on the job, but we lost many of our good men who could not make a living on such hours, so we weeded men out who we could get along without, and went up to a forty-hour week. We are constantly striving for greater production per man to bring down manufacturing costs.

Our superintendent is a very efficient man, and he has used our shop paper, formen's talks and every other means available to show our men that it is very necessary to produce more if they expect to better their own positions. He recently made up a set of four large cards which contain very pointed remarks as to production, and these are placed in conspicuous places throughout the plant."

The logic of the appeal made through these posters is indisputable. The demand is for lower prices. At the present moment the buying public seem content to sit back and wait for satisfactory reductions. Prices can be lowered by increased production on the part of the workmen in our factories. Failing such increases wages must come down. This will be brought about by unemployment. due to the curtailed demand. Even when the present slack period has passed greater efficiency must rule for keener competition will prevail.



Why Are We Working Short Hours?
BECAUSE our customers are holding back on orders
Why Are They Holding Back?
BECAUSE they are waiting for lower prices
How Can Prices Be Reduced?
By Increasing Production per Man or Reducing Wages
LET'S INCREASE PRODUCTION
DO YOU KNOW?
That as Soon as Every Individual Speeds Up on His or Her Job
Prices Will Be Reduced
and
Business Will Increase
Then We will Return to Normal Working Hours

Reproduction of poster used in Seng plant. Original size 14" x 22"

How to Secure Industrial Stability

Too Much Attention Given to Industrial Unrest and Its Causes—Not Enough to Industrial Stability and How It May be Brought About

D. D. Fennell*

I have taken the subject, "Industrial Stability," because I have with other men in industry been engaged in an attempt to solve some of the problems in industry to-day on the negative side more or less abstractly instead of on the positive side, concretely. We have discussed "industrial unrest" continuously; we have gone the limit in an endeavor to determine the "why" of the high cost of living, and have variously dealt negatively with the most profound subject of the day. What we shall concern ourselves with chiefly at this time is the development of a positive constructive attitude toward securing a measure of industrial stability.

There have been presented to industry all manner of remedies for the ills that are affecting us. Big men with large vision and large plans have become impatient of the disheartening obstacles that continually arise to nullify their best endeavors. It is hard for the man devoting his time to labor matters, as I have been doing for a great many years, not to become impatient. It seems sometimes as though we stood before a great stone wall and could not pass it, could not get through it. As soon as we find a remedy that is applicable to a given situation, we try it some place else and it does not apply. A shop committee is effective in some places because of the personality of the management, but in other places it is ineffective. So with all the various management systems. Some of our leaders in industry are inclined to become discouraged at the slowness with which adjustments are taking place and seem unwilling to take the time and pay the price of working this thing out through thought, purpose and sheer patriotic consideration for industry.

I am inclined to believe that Roger Babson's hope that we might be able to find "God's plan" to obtain industrial stability, as expressed at the recent conference at Wellesley Hills, Mass., was the appeal of a discouraged man so concerned with labor problems that he would find some superhuman means of arriving at a solution of our problems. Such efforts and such conclusions will surely get us nowhere. A committee which endeavored to determine for the conference what "God's plan" might be, finally adopted the "Golden Rule" as approximating its conception of what God's plan might be. In adopting this plan the conference went around in a complete circle, ended where they started, viz., with the plan that every farseeing employer anad every earnest employee is using for a basis and a premise in arriving at right conclusions.

God gave to every man a mind, a conscience, a soul and a heart and with these he said, "Go forth and accomplish." Babson indicates the attitude of many leaders who, in the face of present conditions, have not the patience, the perseverance nor the resourcefulness to think with a clear head, exercise the obligations of leadership with a warm heart and a just purpose, utilize the ingenuity of every phase of engineering science that some time we may secure a reasonable measure of industrial regularity.

Parker points out that conservative biologists estimate that man is about 500,000 years old. It took 350,000 years for man to develop enough mentality and enough inventive genius to sharpen one side of a flint stone and make a knife of it. It was, perhaps, 75,000 years ago that he learned how to handle fire and become the master of fire so as to utilize it for his daily welfare. It was, at least, 10,000 years ago that man entered Europe, and he has not changed very much in his psychology since that time. Between 1760 and 1800, more progress was made by mankind than in the preceding 500,000 years, because over night the whole scope of man's life was changed, and possibly this was done by three men, Arkwright, Compton and Watt, who, through their inventive genius gave to mankind machinery, and then the real progress of the human race commenced. Prior to the introduction of machinery men puttered much and produced little.

The present day industrial unrest is not because of the high cost of living that is merely a manifestation; it is not because, gentlemen, of war or of the inflation of the currency; it is, if you please, the result of a century and one-half of the opposition of man to use his own creation, the machine. In other words, the machine has progressed so rapidly and man's inventive genius have gone so far that it has run ahead of man's power to control and hold it, and so to-day we are just feeling our way, trying to find out what are the right relations of mankind to the tremendous machine technique which he has established and whichever insists on human conformation.

In the last analysis we are all students in the great school of life, the beginnings of which are in the hidden past with all the future before. Our best endeavors, consciously or unconsciously, we are contributing to the solving of immediate problems for immediate needs and if our accomplishments are constructive we are building for all the future relations of men. It is presumption for us to conceive that we can effect permanent industrial stability by any acts that we may perform to-day. We can only direct the actions of men. We can only afford, if you please, a vehicle and an avenue whereby men are enabled to go forward. Mankind moves quite like the River Niagara. If you dam it, it will break down the dam and inundate everything within its reach. The industrial problems of one hundred years from now will be just as real and difficult as they are to-day. It behooves the man charged with the responsibility for leadership in industry to concede that only as man-power is utilized along legitimate and just lines can any sort of temporary industrial stability be attained. That can be done by putting flood-gates in the great river of humanity and by installing great turbines that this tremendous power shall be used efficiently and productively with a fulsomeness of happiness in the doing. To help direct the river of humanity of which we are all a part is the great job of life to-day.

Before the surgeon commences to build up the patient to secure the proper functioning of his composite organization he operates to remove those causes that are detrimental to his purpose. There must be a great housecleaning to industry before distinct progress is possible.

(To be continued in January issue)

THINNERS look very much alike in the can. But they act differently under the brush, or in the sprayer.

Some "set" too fast — others not fast enough. Brushmarks and bristles result from the first, pits and dustmarks from the second. Unless the dust conditions are unusually bad, it is generally agreed that better results are obtained with a thinner which does not evaporate too quickly.

We have tried hard to produce a satisfactory thinner. That we have done so, is vouched for by the rather large list of its consistent users.

Although LaTuque Turpentine evaporates smoothly and evenly in a reasonable length of time, it has great penetrating power — a decided advantage in some types of oil stains.

We invite requests for samples, for steady users generally result. Why not write us today?

La Tuque WOOD Turpentine

Where Finishing Troubles Originate?

Faulty Work Means Fewer Sales—Finishers Not Always to Blame—Good Finish Will Not Supplement Poor Mechanical Work

By John N. Moore

While good light is necessary for the finishing room, strong light often exaggerates defects. It brings out defects in a piece of wood in the same manner that a strong light from an automobile lamp exaggerates every little depression on an asphalt pavement and makes the street look really dangerously rough. A strong light will exaggerate the surface of the wood so that sometimes a very bad impression of the workmanship is formed.

Recently, a prominent lawyer made up his mind to refurnish his office in mahogany, and went to an office furniture establishment to select and make purchases. This attorney was really much more interested in appearances than in cost, and with this idea in the back of his head, selected the most expensive suite on the floor, and ordered it sent over to the office at once.

Desk Top at Fault.

The lawyer being a good customer, the dealer, anxious to please him, had the pieces carried out on to the sidewalk preparatory to being loaded on the truck, and the purchaser very happy in the thought of the fine appearance his office would present when this new desk, chairs, table, etc., should be installed, lingered to take in the general effect. Now, this little affair happened on a very sunshiny day, and the buyer happened to take a position where the reflection was cast on the polished top of the big double desk. In that light the surface presented an appearance that was about as smooth as that of a pond, ruffled by a gentle breeze. The purchaser noticed this wavy appearance, went back into the store and registered a complaint that the desk top was not smooth, and there really was no arguing him out of it.

As a matter of fact, no defects were noticeable when the hand was passed over the top, but he could see them, dissatisfaction was created, and being unable to find another piece in the store that met his approval, he called the whole thing off and went down the street to rebuy at another store.

Result of Hasty Work.

Now, a close examination of the desk top showed that the cause of the whole trouble was, that common one of trying to rush the work through the factory. The desk was veneered and the core had been glued up and then sanded before the glue had ample time to thoroughly and perfectly dry. The core being made of pieces about four inches wide, as the glue joints dried, they pulled the cross banding and face veneer down with them just enough to show very plainly when a high finish was applied and the top displayed under lights of a certain character.

Of course, this particular dealer, after this unfortunate experience, went back at the manufacturer, who also lost a sale, but that wasn't the worst part of it, he lost the customer as well, because you know a dissatisfied customer doesn't keep his dislikes to himself, it is quite human to pass them around. The probabilities were the face veneer was too thin to stand sanding to a level, so the only way to repair the top would be to sand the surface smooth and apply new veneer, which, of course, is a rather expensive job.

Light and Ventilation Important.

Incidents similar to the above should serve as a warning to manufacturers of fine veneered goods. There is always something lost somewhere along the route to a sale by rushing goods through. It is an expensive proposition at best, for unless plenty of time is allowed for the cores to dry out before the veneer is applied, very troublesome effects are more than apt to result, and while we are speaking of light, a few words on proper air might not be amiss.

Ventilation of the finishing room is a very important feature, and generally speaking, there are very few rooms where finishing is done that are really properly ventilated, and yet ventilation should be one of the most important things about the department.

In consequence of poor facilities for ventilating, the necessity for a supply of fresh air and the elimination of gases which arise in the finishing room, the workmen adopt many devices with a view to accomplishing the desired result, but which are not always to the best interest of the work in process of finishing. For instance, workmen applying varnish surfaces or shellac will open a window and allow the air from the outside to come in direct contact with the material they are using regardless of consequences, which are sometimes almost disastrous.

Drafts as Cause of Trouble.

For the perfect hardening and drying of varnish it is essential to have good light and good ventilation, being careful always to avoid drafts. For instance, a workman is applying shellac dissolved in alcohol; nearby is an open window and the air coming through from the outside is moist, and comes in direct contact with the work in hand. In the case of the use of orange shellac it will at once take on a greenish cast, and if bleached shellac is being used, it will become opaque, entirely hiding the wood in places. This greenish cast apparently disappears as the shellac undergoes the drying process, and the bleached shellac will gradually lose its opaqueness.

Now, many a workman does not know the cause of that which is transpiring before him, and as mentioned, if the trouble disappears within a short period, he concludes that nothing serious has taken place, but orange shellac thus applied will never become quite as clear as it would have been had it been applied under proper conditions; nor the bleached shellac quite as transparent as would have been the case had it never become opaque.

You will also find that trouble with mahogany and walnut goods which show a gray cast after they are finished can frequently be traced to a source of too much air. After all the apparently inconsequential items of light and air play a big part in proper finishing.

Are Open Pore Finishes Gaining Favor?

Cheaper to Produce Than Filled Finish—Wood Lacquer Gives Good Results—Are Attractive and Durable—Should be Better Known

By Walter K. Schmidt

All open pore finishes—as understood by the trade—have been made on oak, of which fumed oak to-day is the best example. Although we admit this fact, we must not forget that old and new Cathedral are still being produced, especially in buildings where the interior trim and the seatings are thus finished.

With the present price of oak, there is a tendency to darker finishes, both in filled and open pore work. All finishers know that there is an advantage to open pore finishes—the main one being the expense of production. There seems to be a tendency to produce open pore finishes both on mahogany and walnut. The introduction is being made by higher grade factories, where the price of the goods produced will warrant care in selecting the best woods, which to a certain degree are a requisite to the better grade of furniture, and especially that finished with open pore. The idea seems to work in nicely with the present day tendencies to avoid piling on heavy coats of varnish. This fact is manifested in the finish. Instead of looking through a glassy coating, the present day finish is thinner and it appears more as a part of the wood. If the open pore style should take with the consuming public, a great saving would be possible from the fact that an open pore finish requires much less time, material and labor.

Filler is of quite modern introduction. Some of the most beautiful pieces made by the old masters have no filler whatever, and they are still improving with age. Their open pores do not detract from their beauty.

Water Stain Preferable.

In producing a finish of this kind, no matter what wood is employed, water stain is preferable. In many cases it can be used as a sponging coat, by making the stain a trifle lighter and obtaining the color by bountiful application. The grain is sufficiently raised, the pores opened, and at the same time the stain has penetrated enough so that the sanding will not cut through and it will permit of cleaning out the pores so that a beautiful smooth surface is presented. It is quite noticeable that more time and pains are taken in the sanding and smoothing of the wood before finishing materials are added, for it is quite evident that heretofore we depended upon the several coats of heavy varnish, which, when being smoothed would give us an absolutely level top so requisite to the final finish. If this level is produced before the finishing material is applied, the results are much better because of the fact, as mentioned above, that the finishing coats appear to be an actual part of the wood.

This class of finishes is produced in various ways. Two of them stand out noticeably because they are prepared smoothly in oil stains where asphaltum is the base of the color producing stain. These are known as old and new Cathedrals. There are some golden oak finishes with open pores, but very few. Asphaltum here is likewise the base. The final coats are usually obtained by giving the work one coat of shellac, and then waxing. In the cheaper grades of work, so called liquid wax is employed, which can be sprayed, brushed or wiped, and in many cases very little rubbing or polishing is done. While this gives a temporary finish, in a few years the wood has a dead appearance. It has a color, but it is not satisfactory as a finished piece should be. There is a certain disintegration—a mealy dead appearance of the finish, which the housewife cannot revive with the ordinary materials usually at hand. It can not be expected that this class of furniture can be rewaxed by their owners, which would really be the proper way of keeping it in condition. The truth of the matter is that the finishes are too short-lived.

Excellent Results With Lacquers.

In the present day method, especially on the better grades of furniture, where wood lacquers are employed, there can be no possibiilty of this trouble. After the wood is stained and properly prepared, a wash coat of genuine shellac with one or two coats of first quality wood lacquer, and then a spray coat of mat lacquer will give an open pore finish that is waterproof, the pores are protected, the finish is so thin that it is a part of the wood and it will endure for years.

These latter day wood lacquers must not be confounded with the metal lacquers that have often found their way into the woodworking industry, and often erroneously referred to as "Banana oil." They are rather a scientific compound combining the peculiar qualities of Pyroxylin with those specially treated gums, and when correctly made will not whiten in the pores. They will permit of being rubbed dull, but it has been found advantageous to use a last coat specially prepared so that without rubbing it will give the desired mat effect.

Water and Heatproof Finish

These finishes prepared with the use of lacquers will retain their brilliancy and are in no way offensive to the eye. In many ways one might say they give that soft effect produced by the old masters. Besides having waterproof qualities and heat proof qualities, they always remain fresh and lifelike. In the waxing proposition there was always the expense of rubbing. This is entirely done away with wood lacquer. Two days will suffice for a finished job after the staining coat has been applied. This factor alone should appeal to the furniture manufacturer. Especially is it adapted to close grained woods and small articles, such as lamps, candlesticks, small pieces of fancy furniture, brush handles, brush backs, tool handles, curtain poles, picture frames and a thousand and one other wood products where an absolutely durable and lasting finish is desired.

That the woodworking industries have not taken on this process in order to save time is due to a large degree to the misconception of the product. The old time finisher thinks of lacquer as the material that he borrowed from the brass workers. He is not aware of the immense strides that have been made in the rebuilding of this old-time product into what is now known as "wood lacquer." While there is yet a similarity of odor, it is not at all objectionable, and a thor-

ough acquaintance with the workings of this newer product will be a convincing argument in its favor.

Resist Hard Wear.

Fixture people have found to their great surprise and satisfaction that immense strides in time saving can be had by resorting to wood lacquers. One of the largest manufacturers of the country is using a spirit stain fiixing it with a spray coat of this wood lacquer, a coat of quick drying varnish, and topping it off with thin wax, which is rubbed out. By this method he accomplishes two or three operations in one, for in rubbing out the wax he sufficiently smoothes the last coat of finishing material to make a very good job. Note the elimination of numerous operations made possible by employing close grain wood. Of course it fits into his line of goods, but it gives a good idea of what can be accomplished where a maker has the nerve and personal initiative to transgress from the conventional methods of doing things.

To convince one's self of the durability, take an ordinary broom handle, a brush handle, or the edge of a show case and compare the wear they receive with that of an ordinary piece of furniture and note the extreme durability of one of these objects finished in the ordinary method. They would be worn through to the wood much sooner. That the open pore finish will again have its day is a foregone conclusion. It only needs the pioneer to learn that the newer way of producing these finishes is more durable than the old way was, and as that conviction gains a foothold, so will the finish again become popular. — "Furniture Manufacturer and Artisan."

Removing Moisture From Air For Sprayer

The most successful method yet devised for taking the moisture out of the air for the spray machine is to pass the air over and through a bed of calcium chloride. There are several ways in which this can be done, Here is the method which has proven highly satisfactory in one of the largest talking machine factories.

A metal cylinder—see illustration—about 6 inches in diameter and five feet long was constructed. Inside of this tank was placed a trough filled with calcium chloride, the full width and length of the tank, but only half the height. About every 12 inches for the full length of the tank are loovers, or flat discs, extending from the top of the tank to the trough. These loovers have a hole on half-inch by two inches on the centre line. The air hits these loovers and is deflected down through the calcium chloride which absorbs all the moisture in the air.

The calcium chloride ought to be changed about once a week. It is not necessary to place a new charge in the trough each week, as the old charge can be thoroughly dried and be used again the following week.

If the spray machines are close to the compressor, one of these tanks will take care of all the lines, but if they are quite a distance apart it is advisable to have a separate tank for each sprayer.—"Finishing Facts."

Veneer Manufacturers Meet in Chicago

The National Veneer and Panel Manufacturers' Association held their annual convention in Chicago, Ill., December 14-15. A very interesting program had been prepared including an opening address by President S. B. Anderson, of Anderson-Tully Co.,, Memphis, Tenn., and addresses by Wm. B. Baker, secretary of the newly former Association of Wood Using Industries, W. H. Anderson, of Arthur Anderson & Co., Chicago Ill.; N. R. Brooks, Guaranty Trust Co., New York, Armin Elmendorf, consulting engineer for the Haskilti Mfg. Co.; Fred. M. Knappen, Grand Rapids Veneer Works, and H. W. Marsh, Editor of "Veneers," Indianapolis, Ind. Reports were presented on general conditions in the veneer industry and covering questions of interest to the association and the industry as a whole.

Origin of Commercial Shellac

Shellac which is so extensively used as a finish for wood comes from India almost exclusively. Attempts to produce it elsewhere have been made, but have not met with success. It is a resin which is produced by a very small insect that feeds on the sap of a certain tree. The resin accumulates about the body of the insect and sometimes so completely buries it that the insect perishes beneath the accumulation of resin. The deposits are scraped from the surface of the tree in the form of a thin crust, and this becomes the shellac of commerce. Before being put to its final use it is refined and converted into liquid form.

The goods may speak for themselves, but they sometimes need a little prompting.

Cutting Costs in Finishing Department

Value of Varnish Drying System Recognized—Increases Production and Reduces Expenses—Freedom From Dust Desirable Feature

By W. D. Philips

The rapid drying of varnish and other finishing material in special drying rooms or kilns is engaging the attention of manufacturers of furniture, phonographs, pianos and similar articles. Many of the more progressive have already installed some form of humidity controlled system, while others are considering some such installation and the results obtained have more than justified their expectations.

Just think of the advantages of being able to dry varnish in from eight to twelve hours. The output of the finishing department is increased. The period required for finishing is shortened by many days. Ideal drying conditions are possible—tending for perfect results. The elimination of dust from the drying surfaces. Space of finishing room may be reduced and many other desirable features will accrue. These all mean greater efficiency, decreased finishing costs and a better finished product.

What Constitutes Good Drying.

Before going into the matter of varnish drying systems, it might be best to first classify, in their order of relative importance, the subject as follows: (1) What is really meant by "drying?" (2) What are the atmospheric requirements for "drying?" (3) How best accomplished or obtained?

"Drying" is really an erroneous term, because the process of hardening a coating or varnish, constitutes a passing off of the volatile matter, and a resultant hardening of the oil as it saturates or absorbs oxygen. An abundance of pure air of moderate humidity content, would produce very good drying results, but these simple requirements are very difficult to obtain; in fact, are impossible to maintain during the entire working day, in the average finishing room. Cleanliness calls for closed windows, etc.; good drying howls for lots of fresh air.

Another drawback is the natural variations of temperature and humidity throughout the year, when the heat varies from below zero to 90 in the shade, and humidity varies from 2 grains moisture per cubic foot of air in the winter to about 11 grains in the summer. It is obvious, therefore, that as the average varnish is compounded under fixed and definite conditions of manufacture, that having various weather conditions to contend with in drying, the solution of the matter, during the four seasons of the year, would be to develop as nearly constant and unvarying conditions in the finishing department, as is possible.

Ideal Conditions Controlled.

It is also a fact that the various departments of manufacture are to-day more or less under mechanical control. Machines can be speeded up or retarded, labor increased or decreased, and general manufacturing conditions adjusted, but the average manufacturer has no control over the weather or his drying, so that it is imperative that these elements be under proper control if possible. The modern varnish drying apparatus is in reality, or should be, a complete automatically-controlled air conditioning equipment, which not only will produce and maintain ideal controllable drying conditions, but will thoroughly and efficiently ventilate the finishing room as well, eliminating the dust, fumes, etc., that are so detrimental to the workman's health. These conditions are beginning to receive attention from the government authorities.

Another feature in drying, is the fundamental law of chemistry, that, with but very few exceptions, all chemical actions are eccelerated by heat, but heat alone when applied to varnish, enamel, or other similar material, surface hardens such coating, and must, therefore, be applied with a definite humidity content, to act as a mechanical balance. When this is done, the coating is actually dried or hardened from the bottom or inside out, ensuring a perfectly dried surface and eliminating any tendency to shrink or crawl that might manifest itself under less ideal drying conditions. Surface-dried varnish is only partly oxidized and, therefore, is not thoroughly dry. What is more, when a coating is surfaced dried, it takes much longer to harden thoroughly because the surface is sealed and the oxygen of the air is prevented from reaching the body of the coat.

Desirable Features.

Finally, it is not only necessary to be able to obtain mechanically, perfect drying conditions, but these conditions must be constant, evenly balanced throughout the drying space, and continuously and constantly applied, as well.

Summing up the perfect conditions, we find, therefore, a demand for:—

1st. Absolute cleanliness.
2nd. Large constant volume of pure air.
3rd. Heat for chemical acceleration.
4th. Humidity for mechanical balance of heat.
5th. Automatic control of heat and humidity for constantly maintaining above conditions.
6th. Simplicity in construction of apparatus.
7th. Flexibility in equipment to meet varied physical conditions in factory.
8th. Ventilation of finishing room, preserving health of workmen.

With an installation embodying these points, finishing coats may be dried in a minimum of time, at a minimum cost and with maximum satisfaction.

Gasoline Fumes Highly Explosive

Using gasoline indoors is an extremely dangerous practice. While being handled the gasoline is evaporating and the fumes mixing with the air. Being nearly three times heavier than the air, they flow along the floor like a stream of water, lodging in the low places, perhaps fifty feet away from their source. The explosive force of this mixture is fourteen times greater than dynamite. The tiny drop of gasoline evaporated and exploded by an electric spark propels the heaviest truck. A spark from a horseshoe or an iron tool, a match, an open light, grate, stove or furnace, will explode this death-dealing mixture.

You cannot see this creeping foe on the floor, nor foresee the spark which may set it off to destroy life and property. Adequate floor ventilation will carry these dangerous fumes outside the building.

MACO

New Principle Non-Fading Stain

¶ Under ultra violet ray test it endured the equivalent of thirty days in bright sunshine without the slightest tendency to fade.

¶ It penetrates without raising the grain of the wood.

¶ It can be filled directly over like a spirit stain.

¶ Has the advantages of an oil, a spirit and a water stain with none of their disadvantages.

¶ Write for sample panel and full particulars.

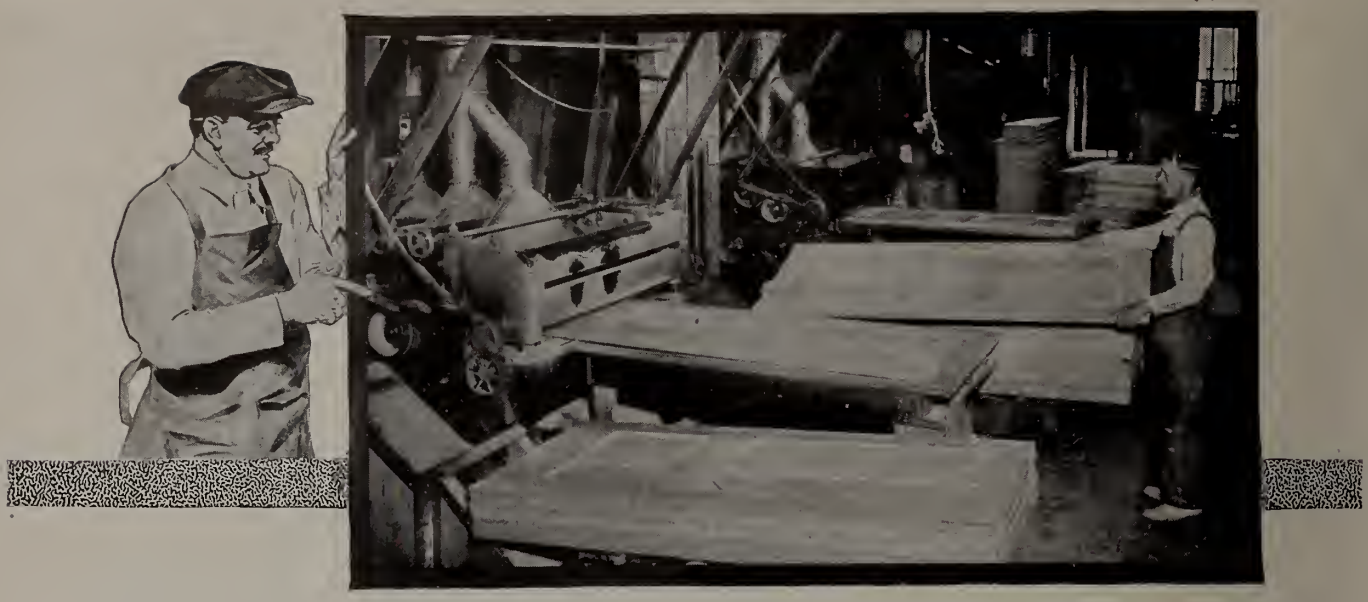
MARIETTA WOOD FINISH SPECIALISTS



Meet John Erickson— (He's a Conservative)

John Erickson is a man you'd like to have working in your plant. John is Head Sander for the Weed Lumber Company of Weed, California. On Sundays you'll find him rolling along with his family in a spotlessly spic-and-span Ford, bound for the open country.

But from Monday to Saturday, year in and year out, you'll find him square on the job—keeping his four big Yates Sanders whirring smoothly at top speed.

I met John one day last April—asked him to give me his experiences with Speed-grits.

"Well," said John in a careful voice, "All I can tell you is that we use your 24" Speed-grits garnet combination on our Berlin Sanders. With it we sand an average of 1800 white pine doors a day on each machine. And we only have to change papers about once in three to four days. That's pretty good for certain."

Here John's conservative side came out.

"I see a lot of advertisements"—he went on, "advertisements in which folks claim that So-and-So's sandpaper is the best. I can't go so far as that about Speed-grits. But I will say this. I've tried pretty near all kinds of sandpaper and for speedy, smooth finishing and long endurance ***Speed-grits has sure got the others I've tried beaten a mile.***"

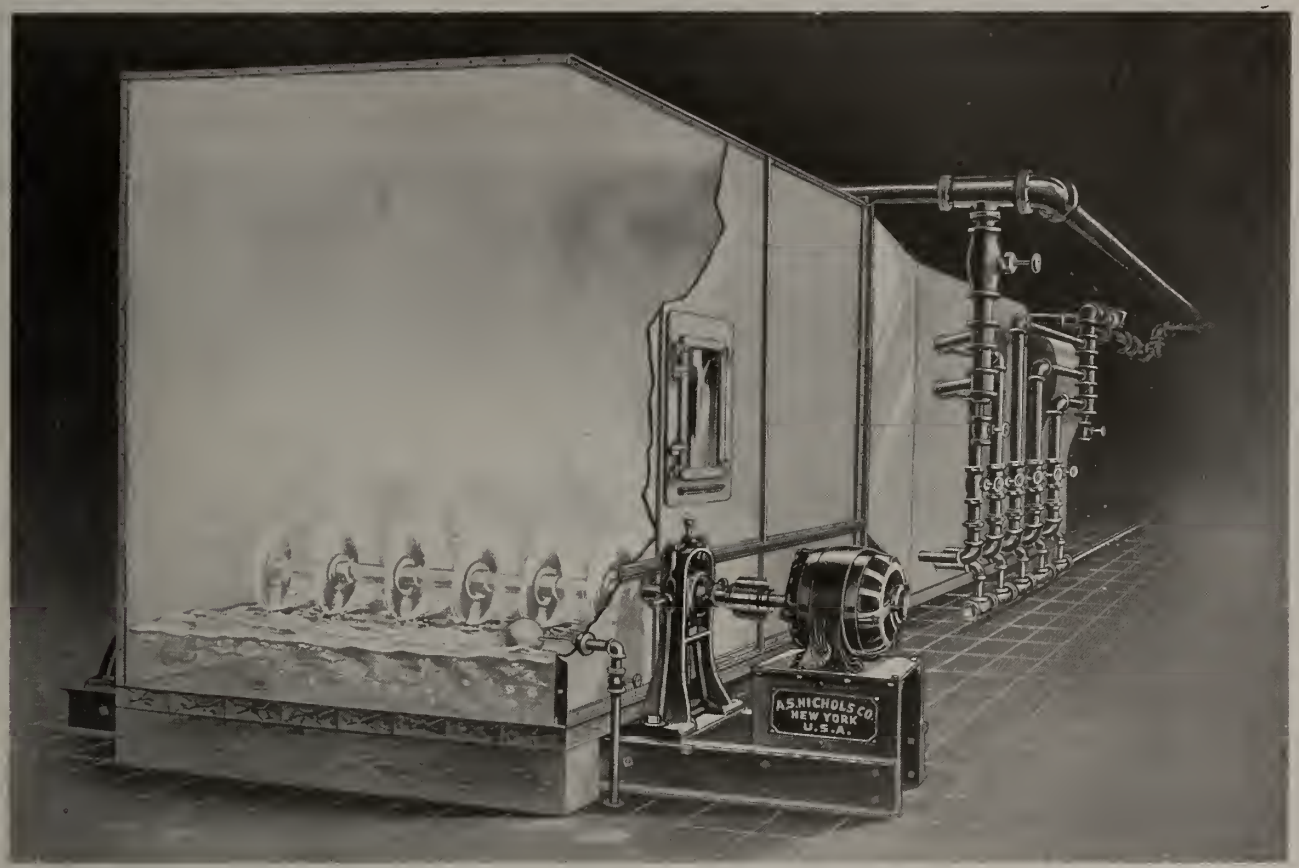
Don't say sandpaper—say Speed-grits



The above photograph shows our complete Varnish Drying Equipment showing air washer and humidifier in operation. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

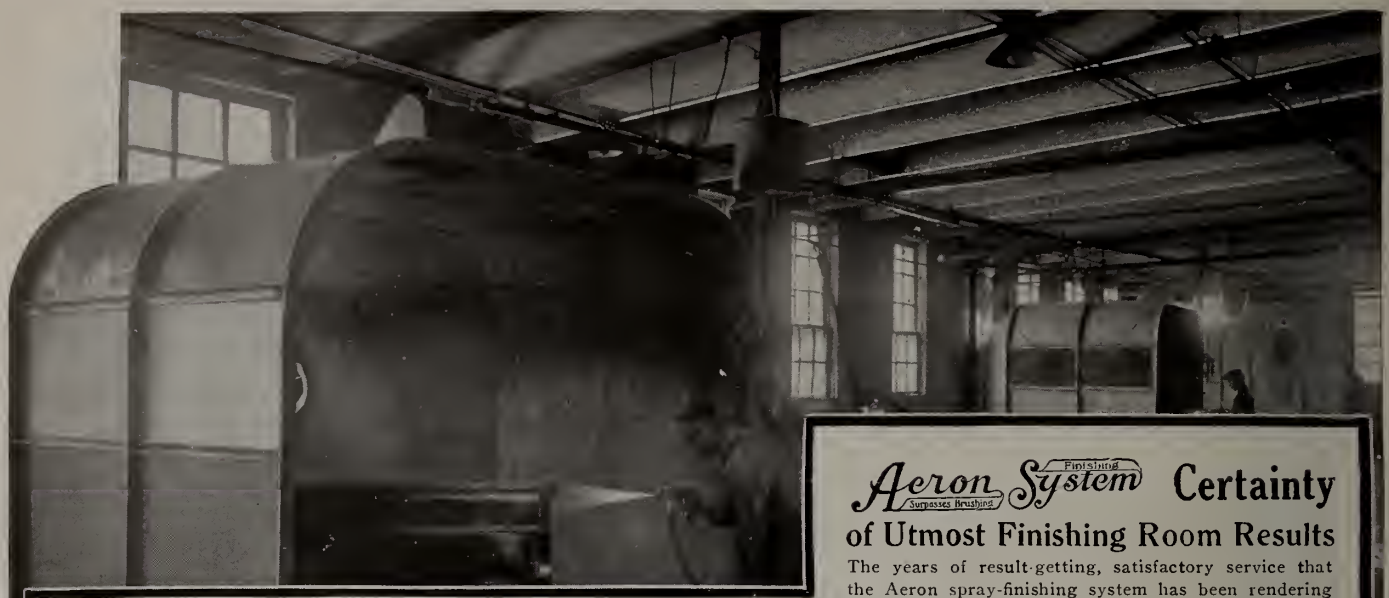
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Aeron Finishing System Surpasses Brushing

Certainty of Utmost Finishing Room Results

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood- and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or a similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 5 or more hand brushers--this is governed by nature of work.

A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.

Work is made absolutely healthful and safe—all fumes are completely removed.

Equipment is kept in the best working condition at practically no cost.

The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

Why We Should Have Confidence

Time of Preparation for Good Business to Come—Entering on Saner Period—Much to Inspire Confidence

By S. B. Anderson*

Since we met last, six months ago, a change has come over the spirit of our dreams. Then we were all at the height of prosperity. More orders booked than we could fill; customers begging for goods, which we could not supply even at the peak prices then prevailing. We do not know exactly what has happened to us. We know our shops are idle, or practically so. No one wants our goods even at the very conservative prices that we might be tempted to quote if the opportunity was offered us. It is a difficult matter to adjust ourselves to present conditions. In the classic inquiry of a generation ago, we are all asking "Who Struck Billy Patterson?" The search for the cause of our present situation can only be valuable as it may help us to solve the very serious problems now facing us.

Are present conditions indicative of what we may expect regularly in the future, or are they simply a letting up to catch breath? Undoubtedly the American public was for a year or two buying mad. Will they rest awhile and take hold again in a reasonable, moderate way, or have they quit? It strikes me that this is the whole question:—Has the American public—the every-day American citizen—quit buying for his wants permanently; quit with a good bit of money lying around loose, or is he just resting up? I think we all know him well enough to be able to answer this question, and I think the answer will be unanimous. If my diagnosis of the case is correct, what are we up against? We are up against a spell of waiting, more or less drawn out, but I hope not an exceedingly long spell. We were flying pretty high and in the course of events we could not expect to always continue on the wing. I think, though, the shots that brought us down were fired a little early. The propaganda of the Treasury Department at Washington, and of the Reserve Banks, while probably well intended, was efficient, but I think premature, and probably more efficient than intended. An immense debt had been created during the war, while prices were high and business rushing. The only time that a big debt can be paid is when prices are high and business good. It is a poor time to attempt to pay when prices of commodities are low, business poor and profits small. I think, in the desire to lower the high cost of living, this fact was overlooked, and the "goose that was laying the golden eggs" into the U. S. Treasury was killed, or, at least, temporary put out of business.

I think now is the time to get ready for good business in the near future—not such a business as we had last year, but a good, healthy business. We all must sharpen our pencils as prices will be close. We must cut out extravagance and useless waste, and introduce economy in the conduct of our business. We will probably all have something of a strain in adjusting ourselves to conditions coming, but I believe any well-equipped, well-organized and well-managed plant will soon again be doing a reasonably profitable business. I fully realize that the buying capacity of our people will be somewhat contracted. The shrinkage in value of farm products during the past few weeks, estimated in some quarters at around seven billion dollars, will reduce the buying ability of our farmers very materially. The inevitable reduction in wages will reduce, more or less, the buying capacity of the workmen, and these are the two classes of buyers that make business good or bad. I have before stated that I thought the interest of the business man ran along with good prices for farm products and good wages to our workmen. I think everything that can be done to restore farm products to a good paying basis should be done, not only in the interests of the farmers, but in our own interest; in the interest of the business man in general. I think it stands the employer of labor in hand to watch himself very closely to see that he does not, in his effort to reduce cost of production, use the pruning knife too freely, and so, while possibly doing an injustice to his employees, injure himself by crippling the buying power of a very large proportion of the American public, a portion that always spends freely if it has anything to spend. The menace facing business is cheap farm products and low wages. Eighty cent wheat and $1.25 wages buy little furniture.

While it is not to our interest to force wages too low, we should not allow the opportunity to pass without bringing about great improvement in labor efficiency. Labor should understand fully that a good day's work must be returned for a good day's wages. If this is not understood and heeded the workman is simply inviting disaster. We should weed out the inefficient workmen and encourage the efficient workmen by paying good, liberal wages—in fact, all the business will stand. We will, by this course, reduce labor cost of our products, and at the same time keep the buying ability of the workingman at a high point.

The natural growth of population of the country has been increasing during the past few years with the usual rapidity, but house building has very largely stopped. It has failed to keep pace with the growth of population so that it is in all cities difficult to find quarters in which to live. Families are doubled up—young couples are living with the old folks instead of starting a new home for themselves. Money has been scarce with which to build. Building material has been too costly to encourage investment in new residences. With the lowering of cost of building material, and labor, money will again be obtainable for building, and this industry will revive. It appears to me that on this one point hangs very largely the future of the furniture trade, and we all recognize the dependence of our line of trade on the prosperity of the furniture business. With the revival of house building will come an enlarged call for furniture. It is estimated that a million new residences are needed now. Think

*Anderson-Tully Co., Memphis, Tenn. Address before National Veneer & Panel Manufacturers' Association.

for a moment what the building of a million houses in the next few years would mean to the furniture trade, and, incidenally, what it will mean to us. And the building is coming—it cannot be put off much longer. I believe there is every reason to feel encouraged. We will be compelled for a while to go slow, but the good time is coming. In the meantime get ready. I believe that we must depend on a good output at close figures for our profit and not a large profit on a small output—and this is better in the long run. Low prices encourage buying and puts goods within the reach of a large buying public. I believe the ideal conditions will be when cost can be made so low that good goods can be placed within the reach of the larger portion of the community. This does not mean that goods will be made without a fair profit, but it means good management, good machinery and good work.

Withall we have reasons for a hopeful outlook. There is much to inspire confidence. The accumulations of the last few years are still in existence. The crops, in spite of low prices, will bring a very large sum of money. The world needs our surplus, and I believe will make some arrangements by which it can make payment. Our transportation system is greatly improved so we will be able to get our goods to market. The majority of our workingmen are still receiving good wages. Credits are slowly easing up. With all this, why should we be pessimistic? Let's cheer up. This of itself will help. Feel optimistic and talk optimism. This will help sales. No one will buy if you bring gloom with you, but if you are optimistic your optimism will spread and sooner or later your customers will feel its effect. There is no reason or excuse for pessimism.

Efficient Installation in Modern Veneer Plant

Automatic Thermostatic Control of Steaming Tanks—Individual Motor Drive on All Equipment—Every Effort Made For High Production and Low Manufacturing Costs

A million dollars in a veneer and lumber plant is an investment that makes one pause and consider, even in these days of big business when the words million and billion seem to be on everybody's tongue. The firm, who recently completed a modern plant at an outlay of one million dollars—The Wood-Mosaic Co., Inc., Louisville, Ky.—should not need any introduction to Canadian wood users, as they have been serving the requirements of the industry in Canada for many years.

The veneer end of this progressive industry is divided into several units so that the most suitable manufacturing facilities may be provided for each type of log. Thus the veneer plant at Huntington, W. Va.,

Concrete vats and huge log handling crane at Wood-Mosaic plant.

operates on yellow poplar crossbanding, the New Albany, Ind., plant is devoted to the manufacture of quartered white oak veneers, while the large new plant at Louisville cuts walnut in plain and fancy figure.

The yellow poplar plant at Huntington, was purchased from the Central Veneer Co., Huntington, W. Va., in 1917. This operation has since been incorporated as the Wood-Mosaic Poplar Veneer Co., and is operated as a subsidiary of the parent organization. The plant is thoroughly modern in every respect and consists of two Coe rotary lathes, a Philadelphia Textile veneer drier, together with the necessary trimmers, clippers, saws, etc. About 40,000,000 feet of 1/24 inch poplar crossbanding makes up the annual production from this unit. The location is a fortunate one with regard to the supply of raw material, as it is surrounded by a fine stand of yellow poplar.

Producing Sawn Oak Veneer.

At New Albany, Ind., production is centred on sawn veneers in high-grade quartered white oak. The raw material for this line is carefully selected and graded before being shipped to the New Albany plant. The equipment here consists of six modern veneer saws, together with the necessary complementary installation.

The pride of them all, and what is claimed to be the most complete and the most modern veneer plant of its kind, is the newly-completed veneer plant at Louisville, Ky. As shown in the accompanying illustration, the factory building is the last word in modern industrial design. It is of the one-storey, monitor type. The walls of the building are nearly all glass, affording unusual light and ventilation. The same progressive spirit was displayed in equipping the plant. The machinery is all new and is driven by individual electric motors with the latest silent chain drive instead of the usual belts and countershafts.

The cutting equipment consists of a 16 ft. Capital slicer, a 10 and a 7 ft. Capital lathe and a 65 inch Coe lathe. The slicer and the Capital lathe are used exclusively for the production of sliced, rotary and half round, plain and figured walnut veneers, including butts and burls. The smaller lathes operate on the same class of poplar crossbanding as the Huntington plant, specializing in thin stock for the cabinet trade.

Mechanical Driers Employed.

The drying of the veneers is a very important operation. This is done with the aid of two new Philadelphia Textile driers. These machines are one 13½ ft. and one 9 ft. wide and 80 feet long. The stock emerges from these mechanical driers dry and flat. The latter is an important consideration. The drying condition in these machines can be so controlled that the veneers may be brought down to any percentage of moisture content desired. Thorough drying at the manufactur-

Two views in Wood-Mosaic veneer plant: One showing veneer driers, the other veener slicer and veneer lathe

ing end eliminates to a certain extent the necessity of redrying the stock before laying, depending largely on the manner in which the veneers were handled in transit and stored upon arrival at destination. The veneer user must not overlook the fact that dry lumber or veneer will absorb moisture if stored in a damp place or exposed to moisture, thus even though the stock was perfectly dry when shipped, if not handled and stored properly, trouble may be experienced unless resort is made to redrying. The Louisville plant has a capacity of 100,000 feet of walnut veneer and 125,000 feet of poplar veneer per day.

The logs are efficiently and economically handled in the yard. The large steel derrick shown in the accompanying illustration is of 10-ton capacity and has an operating radius of 75 feet. The logs and flitches are boiled and treated in four large concrete vats, shown in the same photo. These vats are equipped with automatic thermostatic controlling instruments, thus ensuring uniform treatment of the raw material. Absolute control of the temperature in the vats is also assured.

W. A. MacLean, the president, has been in a large measure responsible for the development and expansion of this progressive firm, which was established in 1883, just 37 years ago. The Louisville operations are under the capable supervision of J. J. Egan and H. C. Hobbs.

Untold Possibilities in Modern Glues

Adapted to Wide Variety of Uses—Require Special Handling for Best Results—Suggestion for Making Curved Panels —Many Other Applications

By M. C. H.

Considering the adaption and capabilities of modern glues in doing veneer work, and comparing them with those of olden days, when hide and bone glues were practically the only adhesive employed in the veneering trade, one is impressed with the great strides made in the turning out of better built-up products and the great future possibilities for veneered work.

In the use of animal glues the process of veneering, at best, has always been a gamble to a certain extent, despite all the rules, regulations and devices developed to obviate this risk. No two batches of animal glue received would ever be exactly the same, and add to this the possibilities of having glue spoiled through overheating, or both glue and veneers spoiled through blistering from having a cold draft enter the glue room, one often wonders that modern glues haven't made their debut years ago.

In the use of modern glues the heating of the glue or the veneering room beyond natural heating requirement is eliminated; the tedious process of mixing glue twenty-four hours in advance of actual requirement is also obviated. Modern glues can be mixed in fifteen minutes, in which a sufficient requirement for the entire day's operation can be prepared.

Lower Veneering Costs.

As it was with the hide and bone glues, both having certain advantages in the turning out of certain products, so with the vegetable glues and the casein or waterproofing glues, each having certain merits which make the application of either, in turning out a certain product, the most economical one to use.

Reduction of veneering costs is only one of the advantages attending the use of either one of these modern glues. And another good point in their favor (and quite contrary to the use of hide glue, in which the glue joint often weakened with age), with these new glues a joint once made improves with age, and heat, as well as ordinary moisture, apparently has no effect on them. These glues, as a rule, are uniform; each shipment must come up to the specific standard of its manufacturer before it is allowed to leave the plant.

There are many plants that have changed from animal to vegetable or waterproof glues and are using their old veneering equipment in identically the same manner as before. In fact, these glues will often work more beautifully with the machine spreader (especially if rolls are of the corrugated type) than was possible with animal glues, making a glue joint or bond as strong as the woods.

No Change in Methods.

One thing to guard against, however, in changing to a waterproof glue, is not to relax in the care taken to have absolutely dry veneers for glueing. In some quarters the impression seems to have spread that with the use of waterproof glues, veneers for glueing need not be dried as carefully as when hide glues are used. This, however, is a serious error, considering that it takes but very little water content in any glue to swell thin face veneers, and very little time after the water is applied. Therefore, the application of any kind of glue, animal, vegetable or waterproof, that is mixed with water will swell the face veneers in a very short time; consequently, if a piece of face veneer is used which is wet, and the water content of the glue, which is also absorbed by the veneers, it will load the veneers with such a moisture content that they become swelled. It is only natural that when the moisture dries out and shrinkage takes place, the veneers will shrink, and, not being able to give at the edges as drying takes place, will show up fine checks all over the face.

Many products which to-day are never thought of in connection with built-up stock, are feasible, and will, in a year or two from now, be looked upon as thoroughbred built-up products. A few of these may be casually mentioned here, such as refrigerators in which panels are made with paterproof glue, built-up furniture that can be shipped to the ends of the earth and withstand any climatic condition, table tops that can be soaked in hot water and from which the veneer will not peel, pianos, doors and interior trim which, when once veneered, will stay veneered despite moisture, exposure or accidental flooded conditions. With the ever-increasing shortage of all kinds of wood, glued-up articles will become an absolute necessity.

Overcoming Certain Difficulties.

It has been remarked that, due to the cold state and moisture content of vegetable and waterproof glues, considerable trouble has been experienced in holding very thin face veneers flat, such as crotch mahogany and walnut, after the glue has been applied. To overcome this objection some of the plants making a specialty of these woods have overcome the handicap by spreading glue, not directly on the veneer, but on both sides of tissue paper, the paper then being placed between the sheets to be glued.

In the use of waterproof or vegetable glues the process of drying out of glued-up panels is identically the same as in the use of animal glues, glued-up panels being piled between sticks and placed in the dry room with a temperature of from 110 to 120 degrees, with a humidity of about 50. A mild circulation should at all times be maintained in the dry room. If proper equipment is not at hand, one or two small electric fans, such as are used in offices in the summer, will give very satisfactory results, as a daily operation cost of from 10 to 24c.

Bending Curved Panels.

With the use of waterproof glues, curved panels need not be glued up to the desired shape at time of veneering. They can be glued up flat and can then be molded to any desired shape by soaking or steaming, bending to desired form, and retaining in that shape until dry. In cases where a stair riser with half or quarter-circle is desired, a very practical method being used is to place the waterproof veneered panels between wet blankets for ten or twelve hours, when they will be in a thoroughly pliable condition to be bent in any desired form.

As predicted over a year ago, the automobile with a body made of plywood with waterproof glue, has arrived. An automobile concern has recently started operations in Buffalo, N.Y., using and featuring the plywood-panel body. Due to the lighter weight of a built-up body, and several other features, the claim is made that a five-passenger car of 121-in. wheel base is produced, weighing less than 1,500 lbs., and giving a mileage of from thirty to forty miles per gallon of gas, and about 15,000 miles per set of tires.

The manufacturer of this car has the following to say: "The new principle in automobile construction of building the body without a steel frame, eliminating much of the weight of the car, is accomplished by the use of plywood, the strongest and lightest structural material known. Plywood is from 300 to 400 per cent. stronger than steel and lighter in weight than ordinary wood; as in airplane construction, where the factor of safety is so important, under circumstances of great stress, sudden shock and intense vibration, it has stood up beyond the greatest expectations."

Evidently the use of built-up panels in automobile construction has an assured future before it, and the demand of the public at its very inception augurs well for the wider use of plywood in automobile construction.—Veneers, Indianapolis.

Panels and Rotary Cut Veneers

Considering the present large demand for high-grade cabinets and the extreme scarcity of good panels, it may interest you to know, Mr. Manufacturer, that we now have in stock, and can make immediate shipment of, a very large quantity of both three and five-ply panels for talking machines in either

**Mahogany,
American Walnut,
Quarter Sawed Oak**

We also have for immediate disposal a large supply of birch and gum panels adaptable for shelving.
We are in position to take orders for future delivery. Order now for holiday trade.
We have just received a big shipment of single ply spruce for horn stock. Write us for prices on cross banding and core stock.

George G. Roberts
22 QUINCY STREET, CHICAGO, ILL.

WE HAVE A COMPLETE STOCK OF 3 and 5 PLY PANELS IN VARIOUS WOODS AND THICKNESSES FOR QUICK SHIPMENT

Also offer 3/8" 3 ply Fir s-2-s Panels for Drawer Bottoms and Backing.
1/8" Rotary Cut Northern Red Oak
1/8" Rotary Cut Northern White Oak.
1/8" Birch Veneer 6 to 36" wide 60 to 86" long.
Panels also made to your dimensions.

Logging Our Own Timber In Indiana

AFTER fifty years' operation by one family, on the same spot, our mills are still cutting strictly northern grown oak, walnut and other prominent northern species. Long acquaintance and a clean record make accessible the best log and timber offerings of Northern Indiana, Ohio and Southern Michigan. Our log fleet of eight big trucks and tractors prove the extent of timber available.

The tradition of careful manufacture on the best of machinery has been handed down from generation to generation. Consistent integrity in marketing has for so long been the rule of the house that it has become a habit.

Do You Know What Constitutes Good Core?

Much Fine Work Marred by Poor Cores—Five Essential Factors to Consider—How Certain Common Faults May be Overcome—Equalization of Moisture Content Big Feature

By S. H. Johnstone

The question of properly constructed cores seems to be ever with us. One would think, that, with all that has been written about good core construction, the equalization of moisture content and the necessity for even surfacing, the manufacturer of a veneered product would give a little more attention to this phase of the work in an effort to turn out a first-class product Yet one does not have to look far to find that this is not so.

While walking through the furniture department of the Robert Simpson store, Toronto, parallel depressions on the top of a mahogany dresser, drew the attention of the writer. Upon examination, this piece, which could not by any means be classed as a cheap article, was found to bear the name of a well-known Ontario furniture manufacturer. Now this manufacturer is producing a fine line of furniture and would not, knowingly, allow a piece of his to go on the market in that shape. It is more than possible that the depression noticed was not visable when the dresser left his plant. Be that as it may, they certainly were conspicuous as the piece stood on Simpson's floor.

Core is Determining Factor

It would appear as if in this particular instance that the full significance of a perfect core—the absolute necessity for a dry, well-constructed core—has not been fully realized. There are five outstanding factors in the building of a core, all of which must be observed. They are, sound stock, dryness, equalization of moisture content, smoothness and even thickness. It might be advisable to discuss each point briefly.

It goes without saying that any kind of rough, shaky, knotty stock should not be worked up into cores. The core may not be visible after the veneers are applied, and the pieces included in the finished article, but the veneers and crossbanding in present-day use are none too heavy and such defects as knots and cracks are bound to show through, marring the beauty of what otherwise might have been a perfect surface. The question as to how one can successfully veneer over knots, is often asked. The best way is to use cores that do not contain knots. The best core is that constructed from clear wood of an even texture. then the whole core body is affected, in the same degree, by the moisture of the glue and changes in atmospheric conditions. This is an argument against building-up a core from different woods, that is embodying beech, basswood, spruce and gum, or other woods, in the same core. Each wood will act differently when exposed to moisture and it is possible that one piece may shrink or swell more than the rest, causing a depression or slight elevation to appear on the veneered surface.

Moisture Content and Equalization.

Very little requires to be said about dryness. The average wood user knows that the stock he employs must be dry, otherwise he will be confronted with warping, twisting, checking, shrinking and similar troubles. For the core, it is not sufficient that the average moisture content of a lot of lumber is 5 per cent. Each piece entering into a corebody should be equally dry. A damp piece among a number of dry pieces will shrink as it dries, causing a depression. This is one reason why cores should be sanded or dressed shortly before the veneer is laid.

Equalization is the term used to express the fact that the moisture in a piece of wood or core is equally distributed, or in other words, each part of each piece is equally dry. When stock for a core is glued up, the wood adjoining the joint picks up moisture from the glue and swells. This, after the glue is applied, there is a ridge along each joint. It may not be very high but it is there just the same. As the excess moisture taken from the glue is dried out and equalized, this ridge shrinks back until when the moisture content at the joint is the same as the rest of the piece, the joint is perfectly level again. Suppose the core had been sanded or planed, and the veneer laid, while the wood on either side of the joint was swollen, what would happen? Dressing off the slight ridge would not stop the wood from shrinking. With the veneer on top, the moisture would equalize more slowly, with the result that the piece might be sanded, filled, varnished and rubbed before the shrinkage was completed. In that case surface veneer would be drawn down along each joint and slight depressions, over the joints, would be visible on the finished surface. That is what happened in the case mentioned. The work was hurried through and the excess moisture at the joints was not eliminated until after the article was finished. The remedy is simple. Allow the cores to stand a few days on sticks before they are surfaced. The same applies to a crossbanded core. Give the core all the time possible before surfacing. That is why it is best to surface just before laying the veneers.

Machine Operations Important.

Some manufacturers lay their veneers and crossbanding on the cores as they come from the planer. If this machine is in perfect condition and doing faultless work, this may be permissable, but at best it is a practice that is open to doubt and criticism. Because the veneers and crossbanding used are thin, all planer marks and rough spots, where the wood was worked against the grain, will show through the face veneer. This is often noticed on veneered stock. It does not cost much to run a lot of cores through a drum sander, and it would certainly add to the appearance of the finished product. On a crossbanded core the sanding could be done just before laying the face veneer.

Any inequalities in the thickness of a number of cores can cause a lot of trouble. If the planer knives are not straight or are not set parallel to the bed, the slight variation which results, when multiplied by the number of pieces in a press load, say 15, means that very little pressure is being applied on the thin spots. This often accounts for loose veneers and blisters. A final sanding, if the sander is doing perfect work, will remedy this trouble.

There is sufficient material for a whole article in each of the points touched on. That being the case, it was possible to only briefly touch on the main features. However, if this article causes the reader to pause and consider, it will have accomplished something.

There's Many a Slip—!

What does it avail a man that he builds well if he fails to paint his dwelling?

It is easy for even the novice to build a good sawmill (if he has the money) but after the mill starts to saw lumber **knowledge** that comes only through long experience and study counts most.

Our manufacturing plants (four sawmills—three veneer plants) are not only as perfect as money plus experience can make them but—each plant is designed to cut only certain stock.

Trained supervision follows the product from the woods (where twenty men are needed to pick the quality of timber we want) to the shipping platform. Deviation from consistent merit is impossible.

Try Wood-Mosaic standard of white oak, walnut, ash, poplar and other hardwood lumber—sawed quartered white oak veneers, sliced and rotary cut walnut veneers and rotary cut yellow poplar cross banding.

Experienced Care in Handling is the Basis of Our Recognized Quality

LOUISVILLE, KENTUCKY

Why Veneering Troubles Still Persist

In Spite of Improved Methods and More Accurate Knowledge, Veneering is Vexatious Operation—A Few Suggestions

By Dick New

It seems only logical to assume that, as much progress has been made in the art of veneering during the last few years, many of the veneering problems, which troubled the old-time glue man, have been overcome. We point with pride to the advance made in the design and manufacturing of veneering equipment, the new and improved glues in every-day use. We have a greater knowledge of the action of moisture in veneers and in core bodies and seemingly have the manufacture of glued-up material down to a fine science. But the question is,—Has this increased knowledge brought us any nearer to the point where veneer troubles have been overcome? The answer seems to be in the negative, for with all our modern equipment and with all the knowledge gained during the last few years, we still struggle on with the same old problems, but, perhaps, in a different way.

Whereas in the old days it was a question of working in the dark in trying to find the cause for warped and checked panels and other similar defects, to-day we know what causes these troubles and to a large extent how they may be prevented, but owing to the fact that the modern manufacturer aims at high production, he seems willing to take a chance on things turning out right rather than following, strictly, the rules laid down by modern veneering practices.

Not Content to Do Things Well.

The same applies to the man in the shop. The operator in charge of drying the veneer, will hurry things along by allowing a little less time for the veneer and core stock to dry. If this is the attitude of the average manufacturer and mechanic in his employ, is it any wonder that the old troubles are ever with us. Thus it may be said that the veneering troubles encountered to-day are not due so much to ignorance as to what constitutes good veneering, practices as to the gambling instinct of every human being, of just taking one more chance, and then trusting to good luck that the results will be satisfactory.

This is the practice of the man laying up the veneers, who says a minute or two longer to put it under pressure won't make any difference, or of the operator of the hydraulic press, who takes the attitude that too much pressure is better than not enough, and gives it the limit. In the buying department the buyer may know that a certain batch of glue or veneer offered him at a cut price may not come up to the exact requirements of his product, yet he sees an opportunity of saving a few cents or dollars on the first cost and decides to take a chance, then, perhaps, wonders why certain troubles are encountered or why the quality of the finished product is not up to the standard.

Modern Methods Responsible.

However, apart from the human factor, modern methods and modern equipment have developed troubles of their own. Thus the use of the newer casein waterproof glues has led some veneer men to think that the drying of the veneer and core is not so essential as when animal glue was employed. True, on certain grades of work, fair results have been obtained by glueing up material with a fairly high percentage of moisture content, but this applies only to a very limited class of work. For a high-class product and in all face work, it is just as necessary to have the stock absolutely dry when using casein glues as it was with animal glue.

Another new development in the adhesive field is sillicate of soda. This is being used to a large extent in the making of plywood for box shooks and other similar short-lived veneered products. While in its present state of development it is not suitable for the better grade of built-up work, it is possible that the time is not far distant when some of the present-day objections to its use have been overcome and this material will take its place among the other adhesives used in the veneering business.

Cause of Hair-line Checks.

It is not so long ago when the appearance of hair-lined checks in face veneers was ascribed to moisture in the veneer or moisture absorbed from the glue. Recently, however, the conclusion has been reached that only about 25 per cent. of the trouble from the hair-lined checks is traceable to moisture, and the other 75 per cent. results from the application of too much pressure. Heavy pressure, that is, beyond the requirements of the work in hand, tends to force the thin face veneers into the cross-banding, thus crushing and rupturing the fibres in the face stock. The veneer at this time is full of glue moisture and these little breaks and checks are not noticeable and often do not show up until after the application of the stains or varnishes. An article in the October issue of the "Canadian Woodworker" outlined the method of calculating the pressure per square inch, and also gave a table, showing the gauge readings for various-sized panels to give a square inch pressure of 100 lbs. Very little information is available as to the best pressures to use, but the general consensus of opinion seems to be that a pressure of from 100 to 150 lbs. per square inch is satisfactory. Those in charge of the veneering department could profitably do a little experimenting in an endeavor to determine the best pressure for the work they put through.

One often hears the merits of metal and composition caul boards discussed. In the writer's opinion the very best caul for all purposes is a plywood caul made of some absorbent wood such as basswood. A caul of this kind will take care of slight variations in the thickness of the veneers and will also absorb a certain amount of the moisture taken from the glue. If properly handled and carefully treated, the life of a wooden caul is long enough to make it a paying proposition.

Specializing in Chair-making Equipment

The patents and rights to manufacture the chair-making machinery, as formerly made by the Jenkins Machine Co., Sheboygan, Wis., has been secured for the Jenkins Co., by the L. G. McKnight & Son, Co., of Gardner, Mass. As the McKnight Co. have been engaged in producing equipment for making chairs and for cutting and working them, the aquisition of the the patents and right to the Jenkins line of chair-making equipment will tend to round out their line, making it a specialized line of chair-making equipment.

Finest Quality Veneers

We carry in stock, for immediate shipment, 3 and 5 ply Panels in Birch, Oak, and Mahogany — sizes 24" and 30" wide, 48", 60" and 72" long.

Ordering your Veneer requirements from us takes the gamble out of buying—because our stocks are so carefully chosen and so complete that we are always able to give you exactly what you want.

Why not let us send you full particulars.

We have on hand at all times a complete range of American Walnut, Mahogany, Quartered Oak (in all thicknesses) Figured Gum Veneers, and Rotary Cut Veneers in all the popular woods.

INDIANAPOLIS, IND.

How to Distinguish Birch, Beech and Maple

Birch, beech, and maple are very similar in appearance, and have approximately the same weight. Hence it is comparatively easy to mistake one of them for the other. A method which anyone can use to distinguish them is suggested by the U. S. Forest Products Laboratory. The method makes use of the relative width of the pores and medullary rays in the three woods.

If the end grain of birch, beech, or maple is cut smooth with a sharp knife and examined with a hand lens, the pores will be seen as tiny holes distributed fairly evenly over the surface, and the medullary rays will appear as narrow lines of a different shade running at right angles to the growth rings.

In beech some of the rays are very distinct even without a lens. The large rays are fully twice as wide as the largest pores.

In maple the rays are less distinct, and the largest are about the same width as the largest pores.

In birch the rays are very fine, invisible without a lens. The pores are several times larger than the rays, usually being visible to the unaided eye as minute holes on the end grain and as fine grooves on dressed faces of the board. The pores in birch are considerably larger than the pores in beech or maple.

The appearance of the medullary rays on a "quartered" surface is also distinctive. Here they appear in beech as distinct "flakes," the largest being between 1/16 and 1/8 inch in height when measured along the grain of the wood. In maple they are considerably smaller, rarely attaining a height of 1/16 inch. In birch they are comparatively inconspicuous.

Indicating Correct Knife Bevels

Knife bevels for different woods under different conditions are shown on the accompanying sketch. This was taken from a knife chart issued, recently, by the Simonds Canadian Saw Co., Montreal, P.Q. These bevels, which are varied to suit woods of different densities and of varying degrees of dryness, were decided on only after many tests had been made under actual working conditions.

The feed to be carried on ony planer or sticker should be governed largely by the number of knives and the rate at which the head is revolving. The average feed rate runs from 20 to 30 feet a minute for each knife cutting, when the head is revolving at the average rate of 3,000 r.p.m. Thus a head carrying four knives running at 3,000 r.p.m. would stand a feed up to 120 feet per minute. If six knives were attached a feed as high as 180 feet a minute could be carried.

Have Lumber Prices Reached Rock Bottom?

Indications Point to an Awakening Demand — Production Curtailed with Stock Below Normal—Stabilization Would Benefit Producer and Consumer

By L. R. Wright

In the November issue of the "Canadian Woodworker," I made the suggestion that the present is an opportune time to sort-up and fill-out depleted lumber stocks. I want to reiterate and emphasize that suggestion. Indications point to the fact that lumber prices have reached their lowest levels and that the next movement will be upward. That being the case, the wise wood-user will estimate his requirements and enter the market before prices stiffen and increase.

One of the main reasons for stating that lumber prices have reached their lowest ebb, is that signs are not lacking, pointing to an awakening demand. At the first positive signs of a change in the lumber situation, values are bound to stiffen, with an upward tendency. Such signs are not very pronounced but are discernible to those in close touch with the lumber industry. They consist of an increasing number of inquiries for quotations, some by wire, which would not be the case if the request were not prompted by need for such stock, an increasing number of orders for mixed cars, showing that stocks are being checked over and shortages replaced, and, lastly, the placing of a few export orders together with an increased interest on the part of overseas buyers.

Another factor is that many items are selling at and even below the cost of production. The result is curtailed production and cessation of logging and manufacturing operation. This phase is emphasized in the following communication from a gentleman who is in close touch with the conditions in the Southern producing centres: "The writer has just returned from a three weeks' trip among the mills of Arkansas, Louisiana, and Mississippi, and is fairly well acquainted with the production centres, such as Memphis, Tenn., Helena, Ark., Little Rock, Ark., Alexandria, La., and New Orleans, La., and other of the larger shipping points, and feels safe to say that at least 75 per cent. of the mills producing southwestern hardwoods are now closed down, and that another 10 per cent. will be closed shortly.

"Speaking generally, the logging outfits have been taken out of the woods, and the cutting of trees has been discontinued for the winter. Inasmuch as the rainy season will prohibit the resumption of logging until late spring or early summer, it is comparatively easy to figure to a certainty that there will be far from normal supplies in the hands of the producers before August or September, 1921.

"It is the general consensus of opinion among those who have made it a business to find out, that there is, unsold, in the hands of the producers, not over 60 per cent. of the normal stocks of oak, gum, and other southwestern hardwoods. There is no question but that all of the mills would have continued producing, could they have done so without loss of money.

"The stocks now being carried have cost the producer to manufacture, approximately fifty to seventy dollars per M, log run, for oak; and forty to sixty dollars per M for gum—the actual cost dependent, of course, largely upon the quality of the log. The prices obtained from the consumer to-day will average f.o.b. mill, from forty to fifty dollars on oak, and from thirty to thirty-five dollars on gum. These figures give the reason for discontinuance of manufacturing.

"The mill men are very optimistic as to the outlook for the future, and are quite resigned to present conditions, and are prepared to sit and wait until the buyer shows himself above the surface. After studying the habits of the lumber trade for 25 years, I feel safe in the prediction that history will repeat itself, and that when the lumber consumer does come into the market, he will come "en masse," which will, in the nature of things, have a very marked effect upon values.

"If it were possible to convince the consumer of lumber of the truthfulness of the present situation, as stated above, they would recognize the exceptional opportunities now offered, to buy at prices which are below the cost of production, and much less than they will be able to buy after the first of the year. Should a fair percentage of them come into the market now, rather than have them all wait until January, February or March, it would certainly have a very strong tendency to keep the market from skyrocketing."

The same remarks hold true with regard to northern and Canadian hardwoods. Stocks in the hands of wholesalers and lumber manufacturers are low—the estimate is 60 per cent. of normal. This applies more particularly to the higher grades. In addition, this year's cut is not expected to exceed 50 per cent. of that normally brought out. The conclusion is obvious. When buying is resumed, whether in the immediate future or next spring, there is not likely to be enough lumber to go around, with the result that the buyers will be scrambling for stocks and prices will soar.

Such a condition is not healthy and is not desirable either from the standpoint of the lumber manufacturer or of the wood-user. A repetition of the spring market of 1919 can only be prevented by lumber buyers breaking the existing "non-buying" strike and placing orders to cover immediate requirements.

It would not be correct to state that the market has turned and prices are advancing, but the low point in lumber values has been reached and that the next trend will be upward. The manufacturer who enters the market to-day, will not only help to stabilize conditions, to the benefit of his own industry, but will be able to secure his requirements at a figure that will be under the prices prevailing a few months from now.

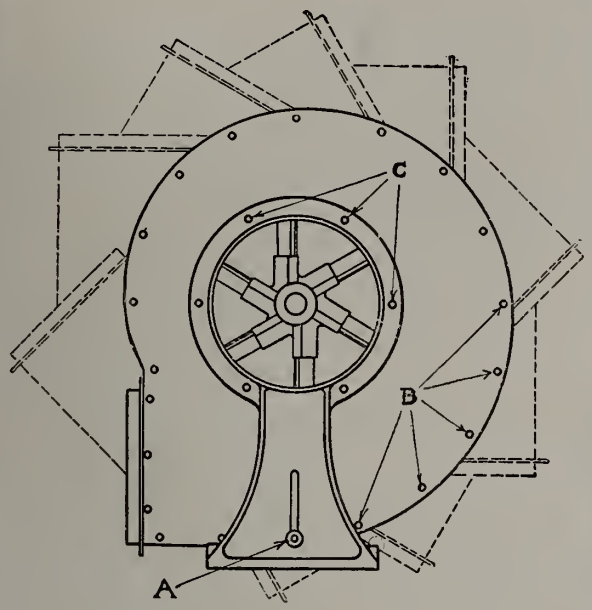
A Real Wooden Wedding

Norfolk, Va., Nov. 11.—When Miss Ada Oakes, daughter of Mr. and Mrs. J. C. Oakes, of Washington, N.C., became the bride of Walter Pine of Salisbury, N.C., recently, the pair had a "wooden wedding." For instance:

The Groom—Walter Pine.
The Bride—Miss Ada Oakes.
The Best Man—Rober L. Birch.
The Bridesmaid—Anna Lee Laurel.
The Preacher—The Rev. Oscar Wood.

The couple went to Hickory, N.C., to spend a week with the bridegroom's aunt, Mrs. E. W. Shingle.

Reversible Housing



One of the features of the Canadian Planing Mill Exhauster is the reversible housing. It is easily adjustable to either hand and to any discharge.

By this arrangement one fan may be used to meet all requirements, thus eliminating crossed belts and sharp angles.

Let our engineering department help you plan your refuse exhauster system.

Information and Inquiries

You are cordially invited to make use of this department

Enamel Baking Ovens

Lawrenceville, P.Q., Nov. 27, 1920.

Editor, "Canadian Woodworker":—

Can you tell me where I can secure information on baking ovens, suitable for baking enamel on small wooden articles? Thanking you in anticipation, I am,

Sincerely yours,
L. H. Millette.

The following firms manufacture industrial ovens suitable for baking enamels on wood: Bellevue Industrial Furnace Co., Detroit, Mich.; American Enamel Co., Providence, R.I., and the Paul Maehler Co., Chicago, Ill. The Consumers Gas Co., Toronto, through their engineering department, are prepared to design and manufacture gas oven of any capacity and to suit any particular requirement.

Graining Machine Wanted

Chatham, Ont., Nov. 27, 1920.

Editor, "Canadian Woodworker":—

I wish to secure a machine for graining. The machine I want is for imitating quartered oak and is used largely for such articles as cheap furniture, incubators, screen doors, etc. Kindly tell me who manufactures such equipment.

Yours truly,
Arthur Dunn.

The Hugh Silver & Son, Prescott, Ont., and the Grand Rapids Panel Co., Grand Rapids, Mich., are manufacturers of graining equipment, rolls, etc.

Clamp Fasteners Wanted

Alliston, Ont., Oct. 27, 1920

Editor "Canadian Woodworker"

Will you kindly inform us where we can purchase clamp fasteners or steel splines, such as are used by the manufacturers of phonographs in assembling the tops.

Yours truly,
J. E. Burnett

The clamp fasteners you require are manufactured by Wm. Siegler & Son, 115 S. Clinton St., Chicago. The Empire Tool Works, Toronto, have made a few of these clamps. Would suggest that you get in touch with them. Mr. McIntyre is the manager.

Wonderlac Shellac Substitute

Chatham, Ont., Nov. 2, 1920

Editor "Canadian Woodworker"

Would like to get in touch with the manufacturing of a shellac substitute called "Wonderlac" and not knowing their name, have referred to you in the hope that you would be able to assist us. Any information you may give will be appreciated.

Yours truly,
S. Hadley Lumber Co.

The shellac substitute to which you refer, namely, "Wonderlac," is manufactured by the Flint Color & Varnish Works of Canada, Limited, Montreal, P. Q.

K. D. Furniture Wanted

A firm in Johannesburg, S.A., who are importers of furniture, are desirous of securing price lists, catalogues, etc., from Canadian furniture manufacturers who are prepared to handle this business and make regular shipments. Desks are important items. When writing for the name of this firm kindly refer to enquiry 2377.

To Clean Hardwood Mouldings

Victoria, B.C., Nov. 2, 1920.

Editor, "Canadian Woodworker":—

Will you endeavor, through your magazine, to find out whether any of your readers can inform me how to clean hardwood mouldings that have been exposed to the weather and become stained. Is there any particular cleanser or wash that would remove this discoloration easily and efficiently? Thanking you in anticipation, we are,

Yours truly,
Knappen Bros.

If any of our readers can supply this information and will co-operate by writing the editor, their kindness will be appreciated.

Butter Boxes Wanted

A Liverpool concern are in the market for 250,000 to 300,000 butter boxes for Irish trade. Delivery February to September. Name on request. Inquiry No. 2234.

Suggestions for Lacing Belts

Much better results would be secured from belts if more attention were paid to lacing. No matter what form of lacing is employed, the laced joint is the weakest place in the belt and is the point where trouble usually begins. The following suggestions may be found helpful in securing greater satisfaction and service from belts:

Cut the ends of the belt square. Do not depend upon your eye or use an ordinary ruler. If the end is cut slantwise, the pull will come on one side.

Make the holes as small as practicable. Use an awl rather than a punch, whenever possible.

Leave a sufficient margin at the edge of the belt without holes so as not to impair its strength. In belts 2 in. to 6 in. wide the holes should be at least ½ in. from the edge, ⅝ in. for belts 6 in. to 12 in. wide, and ¾ in. for belts 12 in. to 18 in. wide.

Make two rows of holes in parallel lines straight across the width of the belt, and stagger them so that the strain comes upon different portions of the belt.

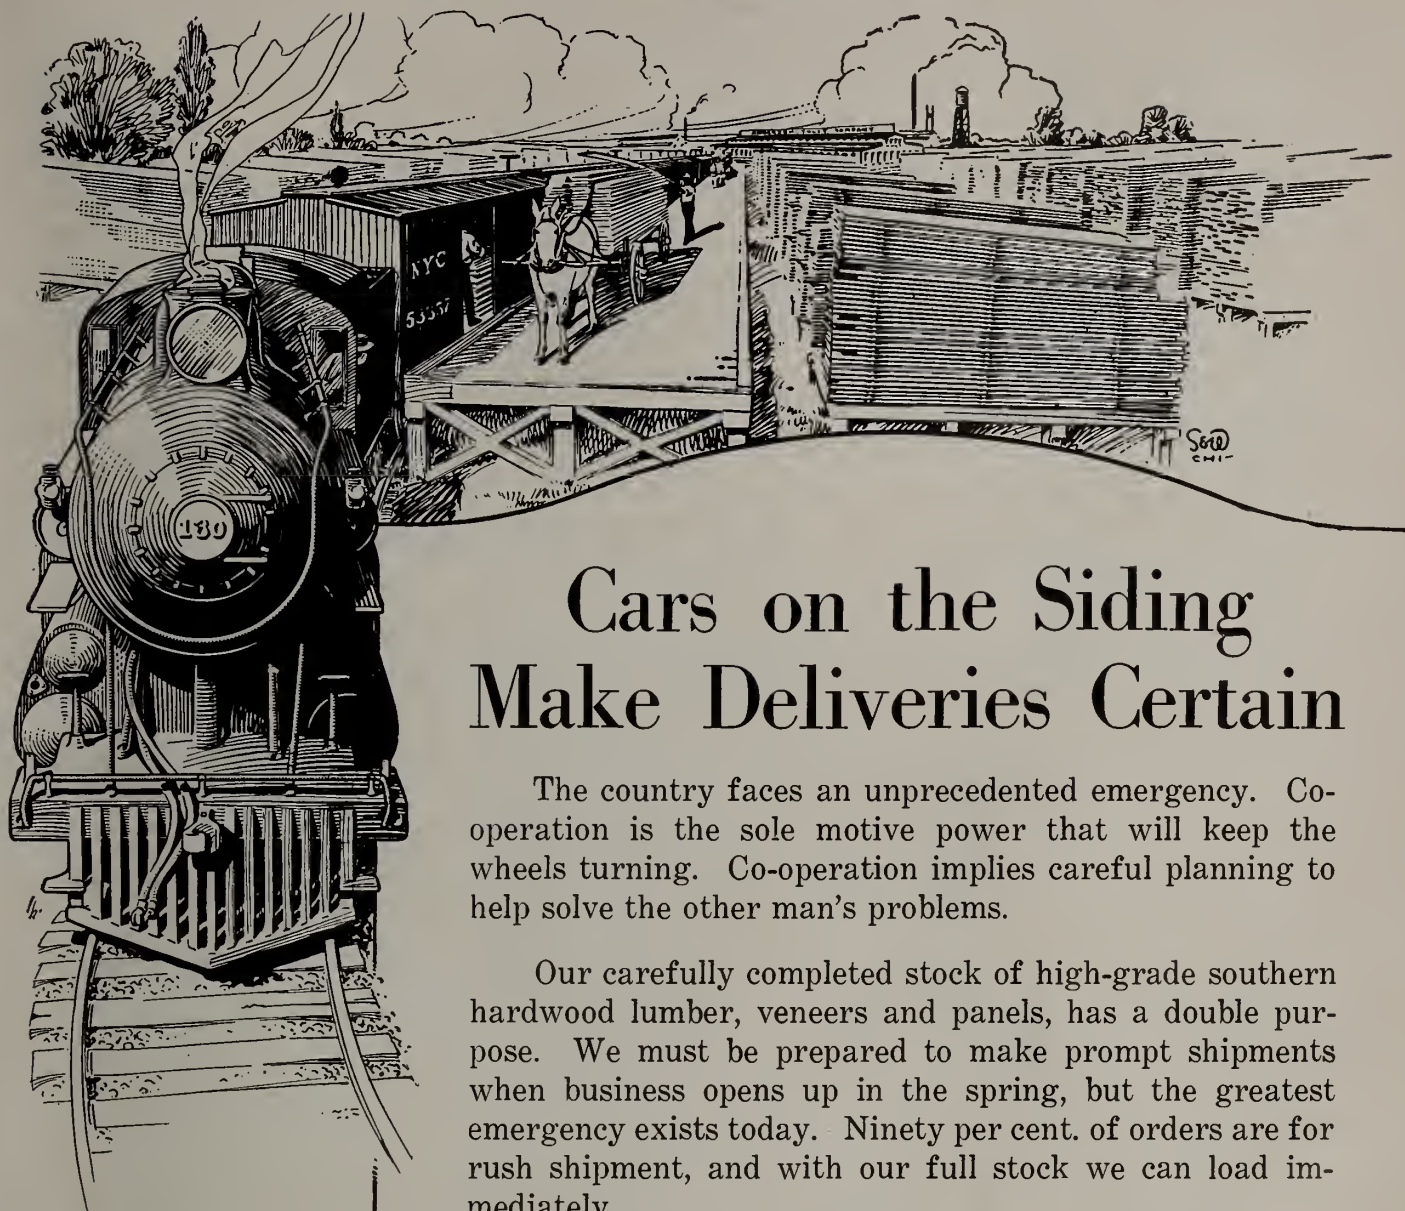
Be sure that the holes in the two ends to be joined match, otherwise there will be a "jog" in the belt, and this may result in tearing the belt lengthwise.

Use flexible lacing, being careful to have it proportionate to the size of the belt. A heavy lacing is likely to cause trouble.

In lacing the belt, make the pulley side as smooth as possible. Rough places and ends should be turned away from the pulley.

In using metal fasteners on rubber belts, select those which place the strain on the lengthwise strands. The crosswise strands are not so strong as those which run lengthwise.

One man tried to repair a planing machine without stopping it. He was caught in the gears. In order to save a minute, he lost his hand.



Cars on the Siding Make Deliveries Certain

The country faces an unprecedented emergency. Co-operation is the sole motive power that will keep the wheels turning. Co-operation implies careful planning to help solve the other man's problems.

Our carefully completed stock of high-grade southern hardwood lumber, veneers and panels, has a double purpose. We must be prepared to make prompt shipments when business opens up in the spring, but the greatest emergency exists today. Ninety per cent. of orders are for rush shipment, and with our full stock we can load immediately.

The location of our mills is insurance of plentiful cars. Cars on the siding and a full stock behind them make immediate delivery certain. Try us.

News of the Trade

The Capital Broom Co., Regina, Sask., are disposing of their plant.

C. Gamelin, Montreal, P.Q., was recently registered as an upholsterer.

The sawmill of P. N. Mathieu, St. Gregoire, Que., was recently destroyed by fire.

The Dominion Furniture Co., Limited, Edmonton, Alta., were recently incorporated.

J. S. Parent & Co., Montreal, P.Q., were recently registered as manufacturers of mops.

West & Little, East Angus, P.Q., sash and door manufacturers, recently dissolved partnership.

The furniture factory operated by Mrs. M. Foster, Ottawa, Ont., was recently destroyed by fire.

Green Bros., Toronto, Ont., manufacturers of interior woodwork, are disposing of their business.

The Fairy Toy Co. has leased the Academy Building, corner of Bond and Dundas Sts., Toronto.

The Canadian Builders' Manufacturers' Woodworker Co., Winnipeg, Man., were recently registered as a partnership.

The plant of the Sterling Woodworking & Construction Co., Limited, Lambert, P.Q., was recently destroyed bp fire.

The sash and blind factory of C. F. Moore, Limited, St. Lambert, P.Q., was completely destroyed by fire. The loss is $15,000.

The rights for Great Britain of the Lloyd loom for manufacturing wicker furniture, has been secured by Messrs. Lusty & Sons of London, England.

The Toronto carpenters at a mass meeting held in the Labor Temple recently, decided to stand by their wage demand for $1.10 an hour for the coming season.

The Doering Trunk Company, Waterloo, Ont., have been authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $250,000.

The plant of the Duhamel Rattan Furniture Co., Reg'd., St. Hyacinthe, P.Q., are being disposed of by tender. Vincent Lamarre, Montreal, is the authorized trustee.

The Port Arthur Shipbuilding Co., Port Arthur, Ont., recently launched the "Canadian Harvester," a steamer which was built for the Canadian merchant marine.

Messrs. Maguire, Patterson and Palmer (Canada), Limited, who are erecting a $5,000,000 match factory at Pembroke, Ont., were recently registered in Montreal.

Robert Bury & Company (Canada), Limited, Toronto, were recently authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $100,000.

The Halifax Shipyards, Halifax, N.S., recently launched the 5400-ton trader, known as the "Canadian Mariner." This vessel is to be delivered to the Canadian Merchant Marine.

The plant of the Denby Motor Truck Co., Chatham, Ont., has been acquired by J. T. Wood & Son, of Brussels, Ont. This plant will be converted into a knitting factory.

Work is proceeding nicely on the factory being erected by the Progress Spring Bed Co., Limited, Montreal, P.Q. When completed, this new addition will have cost about $10,000.

The Mill Cut Homes & Lumber Co., Limited, Vancouver, B.C., has recently been organized with a capital of $50,000 to manufacture and deal in knock-down or ready-cut houses.

The Hintonburg Planing Mill on Armstrong St., Ottawa, was recently destroyed bp fire. The loss is $2,000. The owner of the mill, Mr. Foster, is considering the advisability of rebuilding.

Beatty Bros., Fergus, Ont., are having plans prepared for a $200,000 addition to their London factory. It is anticipated work will be undertaken on this new extension in the early spring.

I. Johnson & Son, Limited, Toronto, Ont., were recently incorporated as general woodworkers. Capital $60,000. L. Macaulay and H. J. McLaughlin, solicitors, both of Toronto, Ont., are two of the incorporators.

The plant of the Conklin Planing Mill Co., Kingsville, Ont., has been totally destroyed by fire. The loss is estimated at $25,000. The owners plan on rebuilding and will be in the market for the necessary equipment.

There is a possibility that the well-known shipbuilding firm of Wm. Beardmore & Co., of Glasgow, Scotland, will establish a branch in Canada, probably in Montreal. If conditions warrant, the company may build a large plant.

A small blaze occurred in the factory of the Kindel Bed Co., Limited, Stratford, Ont. The damage done was very slight. The blaze originated in the baking oven in which the enamel on the davenport frames, springs, etc., is baked.

The Diamond Brush Co., Limited, Toronto, Ont., were recently granted incorporation by federal charter to manufacture all kinds of brushes. Capital $500,000. Two of the incorporators are M. J. Sage and G. E. Gynn, both of Toronto.

The Wood Hydraulic Hoist & Body Co., of Detroit, Mich., recently opened a Canadian factory at Windsor, Ont. The hoist is used in connection with the dumping of motor trucks, or with unloading devices which are now on the market.

Gelinas, Limited, Three Rivers, P.Q., have been incorporated to manufacture and deal in furniture, toys, boxes and other wood products. Capital $49,000. Two of the incorporated are H. G. Lajoie and A. Lebelle, both of Montreal, P.Q.

All-steel office furniture seems to be growing in popularity in Great Britain. Many new factories have been equipped recently to manufacture office furniture and equipment in steel, and over $200,000 has been expended in equipping these plants.

The Thompson Company, Limited, Sherbrooke, P.Q., have been incorporated to manufacture and deal in spools, bobbins, spindles and wood products. Capital $100,000. C. G. Thompson and J. A. Cook, both of Sherbrook, are two of the incorporators.

The International Button Co., Smith's Falls, Ont., which recently purchased the "Steel" planing mill, has completed the installation of their new equipment and is now taking on operators as fast as they can be trained to handle the different machines.

Goo & Patrick, Limited, Toronto, Ont., have been granted a charter to manufacture and deal in automobiles, motor trucks, carriages and wooden vehicles. Capital $50,000. W. W. Perry and Chas. H. Croft, both of Toronto, are two of the incorporators.

The T. Eaton Co., Limited, of Toronto, have presented the Royal Ontario Museum with a number of pieces of genuine period furniture. Included in the lot is a complete furnished room dating 1740 and other examples of 17th and 18th century furnitury.

The Wallace Shipyards, Limited, North Vancouver, B.C., have about completed their new three-storey carpenter shop. This new addition was found necessary when the company accepted a contract from the C.P.R. for the construction of a passenger vessel.

The Decalcomania Co. of Canada, Limited, Toronto, Ont., manufacturers of transfers, etc., are erecting a two-storey factory 63 x 148 feet. The building will be of mill and brick construction, and when completed will cost in the neighborhood of $60,000.

Modern Implements, Limited, Walkerville, Ont., have incorporated to manufacture and deal in trucks, aeroplanes, farm implements and wood products. Capital $100,000. Two of the incorporators are H. E. Blood and C. D. Donaven, both of Walkerville, Ont.

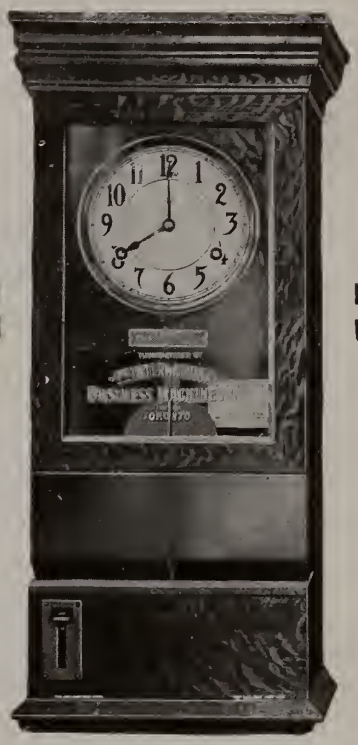
Stevenson Bros., Limited, Toronto, Ont., were recently granted a federal charter to manufacture and deal in furniture, roofing and all kinds of woodenware. Capital $50,000. J. F. Stevenson and G. C. Stevenson, both of Toronto, are two of the incorporators.

A boiler in a new cooperage factory at Fort Coulonge, Que., belonging to the Sutherland-Innes Co., Limited, of Chatham, Ont., recently exploded, killing one of the employees and injuring a number of others. The reasons for the accident are not known.

Warren & Son, Woodstock, Ont., are working on a large organ for the Pantages Theatre in Toronto. This is the largest theatre organ in Canada but a larger one is contemplated for the theatre being erected in Montreal by the Famous Players' Corporation.

After being closed down for a few weeks, the plant of the North American Bent Chair Co., Limited, Owen Sound,

First Assistant to the Superintendent



INTERNATIONAL JOB TIME RECORDERS

George Martin, superintendent of the Blank Furniture Manufacturing Co., was talking to one of the International salesmen.

"I'll tell you," said George, "that International Job Time Recorder is one thing I couldn't and wouldn't do without—I call it my **first assistant.**"

"Just take a look around this workroom," said George, with a wave of his hand, "Every man at his bench or machine, and they smile while they work, too. You see the men all know they are timed on every job and **they seem to take a keen delight in trying to cut down on the time necessary for each operation.** And it doesn't affect the quality of their work either, because we have a standard that must be maintained and the men realize it."

"And say," and here George began to get enthusiastic, " the very day the boss put that job time recorder in here I discovered that I had a bunch of 'chair warmers' on my hands. Did I fire them? No, you bet I didn't; some of them are the best workmen I have—all they needed to prove it to themselves and me was that time meter. You've just got to admit that something happened to our production, too! Why some men in this department turn out as much work in a day now as they used to in two."

"Is the boss satisfied?" exclaimed George; "Why say, if he couldn't get another one to take its place money couldn't buy it. He'll tell you so too, and just as soon as our new addition is ready you'll get an order for more."

Does your superintendent need a **first assistant?** Why not ask him?

We would like to show you how many other superintendents are getting greater production from their departments by using International Job Time Recorders. It won't cost you anything to investigate, but it most likely will if you don't.

Also manufacturers of Dayton Scales and Hollerith Electric Tabulators

Ont., has been reopened with practically a full complement of men. Sufficient business is in sight to keep this plant running for an indefinite period.

The plant of the Frontenac Molding & Flash Co., Limited, Kingston, Ont., was recently damaged by fire. The loss is estimated at $3,000. Had it not been for the sprinkler system installed, there is a strong possibility that the whole plant would have been destroyed.

The Gilsy Musical Corporation, Limited, Toronto, Ont., were recently incorporated to manufacture and deal in phonographs and other musical instruments. Capital $40,000. J. R. Roaf and J. Creighton, solicitors, both of Toronto, Ont., are two of the incorporators.

The Tudhope-Anderson Co., Orillia, Ont., manufacturers of carriages and agricultural implements, are extending their business. They recently completed arrangements with Messrs. Bournival & Co., of Montreal, to handle their complete line for the province of Quebec.

The Manufacturers' Lumber Co., Stratford, Ont., have purchased the cooperage plant in Stratford, formerly operated by Merritt & Co., of Chatham, Ont. Hardwood lumber, together with hoops and staves, will comprise the output. About twenty men will be employed.

The Office Equipment Company of Canada, Limited, Montreal, P.Q., have been incorporated to manufacture and deal in office equipment, furniture and other office fixtures. Capital $100,000. Two of the incorporators are W. A. Hayman and P. N. Jacobson, both of Montreal.

The paint and varnish manufacturers of Canada donated $1,600 to the Muskoka Free Hospital through their organization, the Canadian Paint, Oil & Varnish Association. This was collected at a recent meeting of the association and is to be used in rebuilding the above institution.

J. G. Stephenson, who operates a small clothespin factory at Orillia, Ont., was instantly killed, recently, in his plant. Something went wrong with the electric motor and when Mr. Stephenson attempted to pull the switch, his hand came in contact with both live wires with fatal results.

The box factory and planing mill of the Canada Box & Lumber Co., Limoilou, P.Q., was entirely destroyed by a disastrous fire. In addition to the plant, a considerable quantity of lumber went up in flames. The loss is in the neighborhood of $70,000 and is partly covered by insurance.

Maisonneuve Box & Lumber, Limited, Montreal, P.Q., have been incorporated to acquire the business and interests of La Fabrique de Bois Laval, Limitee, and to manufacture all kinds of wooden boxes. Capital $49,500. E. Abel and J. T. Legault, both of Montreal, are two of the incorporators.

Business may be quiet, but that does not seem to have prevented the Goderich Mercantile Co., Goderich, Ont., from closing a rush order with a Toronto firm for over $30,000 worth of furniture. As delivery is to be made by January 15th, it will be necessary to operate the factory both day and night.

J. M. Hughes, Kingston, Ont., has purchased the business known as the Kingston Casualties Reed & Rattan Co., and will carry on the manufacture of reed and rattan articles. This company was started with a view to enabling disabled soldiers to learn an occupation at which they could earn a good wage.

The Canadian Bonom Reversible Steam Turbine Co., Limited, Quebec, P.Q., have been incorporated, under federal charter, to manufacture and deal in automobiles, aeroplanes and wooden vehicles. Capital $100,000. A. Bonom and C. E. Taschereau, both of the city of Quebec, are two of the incorporators.

The Bruce Wood Workers, Limited, Chesley, Ont., who recently took over the plant of the Canada Beds, Limited, are turning out a line of extension table slides, table pins and similar items for the manufacture of extension tables; also a line of wooden parts for automobile running boards, toe boards and seat lids.

It is understood that arrangements have been completed for the reopening of the Dominion Shipbuilding Yards, Toronto. It is not known whether this yard will take on any new work when the two ships on the way are completed. In any event suffcient work is available to keep the plant in operation throughout the winter.

In presenting information before the Tariff Commission, a representative of the paint and varnish industry stated that in 1910 there were only twenty-six firms manufacturing finishing material in Canada, while at the present time forty-five are engaged in this business and their total annual output is valued at over $25,000,000.

A. B. Beverley, recently purchased the premises at 485 King St. W., Toronto, where he operates the National Cabinet Co., producing five hundred phonograph cabinets a month. He intends making substantial additions to his factory. Several new machines will be installed and production increased to a thousand cabinets a month.

Piano Cases and Phonographs, Limited, Brantford, Ont., who are at present operating under federal charter, have been granted incorporation under provincial charter providing the company does not use in Ontario a larger amount of capital than $70,000. The company has appointed W. T. Henderson, of Brantford, to act as their attorney.

A company known as the Acetate Products, Limited, is being formed to operate a chemical plant at Port Mann, B.C., to manufacture chemicals, such as wood alcohol, acetated lime and charcoal from alder wood. This wood will be distilled in large retorts. Acetone is used largely in the manufacture of cordite, while the charcoal will be disposed of to powder manufacturing companies.

According to a decision recently handed down by Judge Denton, several Toronto firms succeeded in obtaining a reduction of business tax assessments. Judge Denton ruled that such firms as Heintzman & Co., Gourlay, Winter & Leeming, Nordheimer & Co., and Frank Stanley, who both manufacture and retail pianos and other musical instruments, be classed as retailers and assessed on a 25 per cent. basis.

The Dominion Rattan Co., Limited, Montreal, P.Q., have been incorporated with a capital of $20,0000 to manufacture and deal in reed and rattan furniture and to take over the business known as the Canadian Reed & Rattan Mfg. Co. The plant of the latter company was damaged by fire a short while ago, but the damage has been repaired and production resumed. R. Larocque is the manager of the new company.

The Grimsby Steel Furniture Co., Grimsby, Ont., are bringing out a new phonograph. For some time past this firm has been making cabinets for the Columbia Gramophone Co. of Toronto, but have decided to branch out and market a line of their own. The new Grimsby phonograph contains a few changes in design and mechanism which it is claimed tend for a better machine both in appearance and tonal qualities.

The spacious building on King St., Toronto, formerly occupied by the Murray-Kay Company, has been secured by a number of Toronto men for the holding of a furniture exhibition early in the new year. This exhibition will be held at the same time as the proposed Stratford and Kitchener shows. In all probability most of the Toronto manufacturers will display their lines. About forty manufacturers will show their lines.

A lot is published about the Germans and Austrians flooding the British market with pianos. One phase of this situation which is worth emphasizing, is the fact that apparently these pianos are not being bought by the British public. Some of the importers of foreign pianos are afraid to even advertise them but are attempting to dispose of them personally at a price below that being asked for the cheapest grade of British make.

The new Canadian plant of the Fulton Motors, Limited, of Farmingdale, Long Island, is to be located at Welland, Ont. An announcement to this effect was recently made by George Day, Industrial Commissioner for Welland. The site secured consists of 4½ acres, including some buildings, but extensions and additions will be necessary. New machinery is being shipped to this plant. A line of trucks from ¾ to 5 h.p. will comprise the Fulton line.

The Emerson Phonograph Co., Inc., of New York, who operate five factories in the United States, have disposed of the Canadian rights to the Emerson-Canadian Co., Limited, a new corporation which is being organized in Brockville, Ont., to manufacture of Emerson records and, ultimately, phonographs. The capital of the new company is $500,000. J. R. A. Lang, Hon. George T. Graham and W. B. Reynolds, all of Brockville, are among the provisional directors

The Listowel ratepapers recently carried the by-law approving a loan of $25,000 to a local corporation recently organized to manufacture automobile wheels and other similar articles. The type of wheel to be made is entirely new and the company has been strongly financed with a view to promoting a large export trade with Great Britain as well as

One reason why our Gum is Straight and Flat

The Ultimate Cost

The cost of lumber in the finished product, furniture, trim, auto bodies, music cabinets or whatever it may be, is what the manufacturer is interested in. Ultimate cost; that's the true yard stick of value.

That's what we're striving for; **to give our patrons the lowest ultimate cost.**

That's why we steam (Kraetzer-Cure) our Gum as it comes from the saw, thus preventing stain, eliminating warp, producing lumber that is **straight, bright** and **flat.**

That's why we use nine stickers in piling our lumber instead of the customary four, five and six; use only carefully selected stickers of unifrom size and have these placed directly over each other in perfect alignment.

That's why in many other details we spend just a little extra money, putting value into our product, which is returned with big dividends to the man who uses it.

We're proud of our lumber; that's why we put our brand on every board. Every car we ship must go into our customer's work exactly according to his calculations. It must produce less waste; be a little better than he expected; **we are satisfied with nothing less.**

Make a thorough comparison with the ordinary kind—**and be convinced.**

Our protection THE KRAETZER-CURED LUMBER CO. *Your guarantee*

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

Band Mills: Greenwood, Miss., Moorhead, Miss.

Why our Gum does not stain

Our Quartered and Plain Red and White Oak, Ash, Hickory, Red Gum and Tupelo is as fine as the highest quality of virgin timbers and thorough knowledge of production can produce. THERE IS NONE BETTER.

cultivating the Canadian market. A building has been secured with trackage on both C. P. R. and G. T. R., and the installation of machinery will be undertaken immediately.

R. W. Milligan, of Orillia, Ont., is negotiating with the city council for the lease of a site on which to erect a hoop mill. If successful in securing a suitable location, Mr. Milligan intends to spend $4,000 on the erection of a plant, and will give employment to 10 or 12 men. While the Industrial Committee of Orillia favored granting Mr. Milligan's request, it was found upon investigation that part of the site desired was under lease to another concern. The matter is being held in abeyance and an exort made to come to some satisfactory arrangement.

The Clarkson Fruit Growers' Association have given a contract to the Oakville Wirebound Box & Basket Co. for their requirements for the 1921 fruit season. This order calls for approximatelp 3,000,000 quart boxes, 200,000 baskets and 45,000 crates. The prices are around 20 per cent higher than those which prevailed last season. In all likelihood the Association would have had to pay more for these containers were it not for the fact that certain British Columbia basket manufacturers were in the field with lower quotations. The B. C. Product, however, differed from the requirements of the local trade.

H. A. Grimsdick of the Bell Piano & Organ Co., Guelph, Ont., in giving evidence before the Tariff Commission, presented the following facts pertaining to the piano and organ industry: In Canada there are 32 factories devoted to the manufacture of these lines, together with 15 plants producing accessories for the piano manufacturing trade. Employment is given to 4,000 men and the annual pay rolls total over $5,000,000. The total investment is in the neighborhood of $15,000,000. In addition, in the retail field there are 402 dealers, employing some 10,500 people and representing an investment of $46,000,000, with an annual turn-over of $50,000,000.

PERSONAL

Mr. MacDonald of the B. C. Manufacturing Co., New Westminster, B. C., was in Toronto recently, calling upon the trade.

Walter C. Laidlaw, of the R. Laidlaw Lumber Co., Toronto, lumberman and general woodworkers, was recently re-appointed president of the Central Neighborhood House at the Ninth Annual Meeting of this institution. The aim of this organization is to show new citizens the best meaning of Canadian nationality and to help them preserve the best in the heritage which they bring with them from their own counties.

H. F. Holton, of Toronto, who is a member of the inspection staff of the National Hardwood Lumber Dealers' Association, has returned from an enjoyable hunting trip near Restoule.

Clayton R. Burt has been appointed general manager of the Willys-Overland, Limited, Toronto, succeeding T. A. Russell. Mr. Burt has had considerable experience in the motor car business, having been assistant manager of the Russell Motor Car Co., Limited, Toronto, for four years and general manager of the Russell Motor Car Co., Buffalo, N. Y., for the past three years. He will assume his new duties immediately.

OBITUARY

T. W. Bennett recently passed away in Toronto. Mr. Bennett was a well-known Newfoundland shipbuilder, having been engaged in the shipbuilding industry in St. John, Newfoundland, for the better part of sixty years.

Herman Heintzman, vice-president of Heintzman & Co. Limited, Toronto, manufacturers of pianos, died recently at his home in that city. Mr. Heintzman was in his sixty-eighth year. He was one of the main figures in the development of the above-mentioned firm.

J. R. Fluker recently passed away in Pembroke, Ont. Mr. Fluker was a well-known commercial man and at different times had represented such firms as the Shurly-Dietrich Co., Limited, of Galt, Ont.; Thomas Pink Co., Pembroke, Ont., and Wood, Vallance & Co., of Hamilton.

James Sparling, who was a prominent resident of Meaford for 54 years, where he operated a planing mill and retail lumber yard, as well as carried on a building and contracting business, died very suddenly at his place of business recently. He was a leading Mason and a life-long member of the Conservative party. Mr. Sparling took a great interest in the work of the Ontario Retail Lumber Dealers' Association and was one of those in attendance at the last annual gathering in Hamilton.

Making Use of Trade Papers

Practically every modern factory or establishment of any kind receive a number of magazines and trade papers dealing with the type of material or equipment it manufactures, general machinery, management, and other topics that are of interest to office and shop employees of that particular industry.

In many cases these papers are received in the office, read by one or two people, and then passed on to the file room, where they are held for some time and then either thrown away or perhaps bound.

One manager felt that these periodicals could be made to do some extra work by making arrangements to pass the trade papers, after they had served their purpose in the office, out to the shop, where they would be distributed to the foreman or any other of the employees who had interest and initiative enough to read them either during the noon hour or at home.

In order to make the periodicals available a rack was built outside of the shop office, where all the papers were placed as received from the office. A sign was placed about the rack stating that the men were free to help themselves to the magazines the request also being made that any papers taken home be returned promptly so that they could be put in circulation. A number of the men took advantage of the opportunity to take the magazines home to read, while many others came to the magazine rack at the beginning of the noon hour and took advantage of the idle hour to look over the literature in which they were interested and from which they could derive benefit, thus utilizing what was previously wasted time.

While the magazines are usually a week or two old before they reach the shops, in the case of the average trade or technical paper the time element is not so important as in current news magazines, and hence the papers serve a useful purpose.

Such a scheme of placing at the disposal of the shop force literature in which they are directly interested, while probably not now, deserves favorable attention from the standpoint of improving both the education and the general spirit of the employees.—"Factory."

Hand-Painted Furniture

One of the big furniture companies that has recently located in the Long Island City section is now making an effort to engage the services of high-class artists to decorate furniture. In sending out the announcement that it is ready to give employment to artists, the firm says that an entirely new line of goods is about to be placed on the market. The decorations are to be similar to those which were used on furniture nearly a century ago and which were used most effectively by foreign makers.

The Annual meeting of the American Walnut Manufacturers' Association will be held at the offices of the association, 616 South Michigan Boulevard, Chicago, Illinois, on Thursday, January 20, 1921.

Turpentine from B.C. Fir

After a trial of a year the Douglas fir turpentine industry is now said to have demonstrated itself as a successful undertaking, capable of expanding to enormous dimensions. This work was first taken up in a somewhat doubtful manner, many of the backers of the scheme being afraid they were venturing into something that would prove to be "another wild cat." But the developments have proven the sound commercial basis of the arguments of the apostle of the venture. The business is established and is growing.

There are vast forests of Douglas fir on the coast, and they provide an inexhaustible source for raw material. The trees are tapped as is a maple tree, and the sap is received in a metal receptacle and shipped to Vancouver, where it is refined into turpentine and rosin. The sap runs in the trees for seven months of the year, and tapping does not injure the timber. In fact, it is said it helps by making a finer grain. Another thing which the turpentine extraction has done is to create a use for trees that hitherto were not considered as marketable. When experiments first were undertaken, the men tapped the finest, biggest, straightest trees they could find. The results were not very promising, as the sap flow was light. As time passed, it was learned that much more sap would come from a fairly poor tree than from a perfect one. Further development along this line showed that the trees on rocky, poor land gave more sap than trees on rich soil. So now practically all the operations under way are being carried out on the areas where soil is poor.

The company that is now operating has adopted a plan of employing farmers and settlers to get the sap. The company provides receptacles and tools, and guarantees to take the sap at a certain minimum figure per gallon at tidewater. It sends launches up the coast at certain intervals to collect, pay the settlers, and carry the product to Vancouver for refining. This company now has 50,000 acres under lease.

Restoring Paintbrushes

Don't throw away the stiff, hard paint brushes, that so often accumulate, and don't buy new ones; but particularly don't buy expensive paint remover to make them usable again.

Put an inch of ordinary vinegar in a granite dish. With the brushes in this, set the pan on the stove and let it boil. As the paint softens and comes off, try working the brushes to help the process. When the vinegar has lost its strength, replace with fresh as often as necessary till the brushes are clean.

A word of caution is necessary at this point: Do not let the vinegar come too high on the brush, where the bristles are held in place. Cement-set or glue-set brushes are liable to soften and let the bristles fall if the boiling vinegar works into the glue or cement. A little care readily overcomes the danger of this.

Fifteen cents' worth of vinegar and an hour's time will make soft, pliable and as good as new, a dozen brushes that have been dried in paint a dozen years.

FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without re-sharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

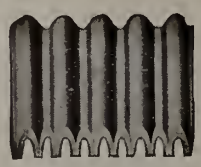
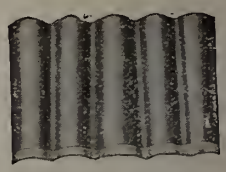
Cary's SUPERIOR QUALITY Corrugated Fasteners



SAW EDGE



PLAIN EDGE

According to final decision, after long litigation, we have been granted the SOLE RIGHT to manufacture a Saw Tooth Corrugated Fastener with a continuous cutting edge. Our fastener is beveled evenly on both sides, which enables fasteners to be driven in straight, and much easier than any other fastener made. Our Corrugated Fastener is made in various widths and corrugations, also in coils wound right and left. Try our products and you will use no other.

Samples and prices on request.

Measure the Output

The Productimeter

Put this little worker on your moulders, matchers, stickers, flooring machines, self-feed rip saws, it will tell you, exactly, any time, just how much lumber has gone through.
It's a real lumber meter, sturdily built to withstand the hardest usage.

Its use will SAVE you MONEY

We have other designs for other machines. Wherever you can, use an automatic counter or measuring device. It's the best and surest way to save loss, avoid disputes, reduce costs.
Tell us what machine you will use it on, and we'll send you a Productimeter for a 30 days' trial.

Get our Catalog. It will interest you

Mr. Nicholas Santa Claus,
Iceland.
Dear Santa Claus:
For fear you will overlook me, I am sending you a list of what I absolutely need this year.
1. Two National Automatic Humidity Controlled Dry Kilns, 44' x 20'
2. Two extra sets Automatic Temperature and Humidity Controls for our present kilns.
3. One testing Scalometer.
4. One crosswise Transfer Car.
5. Twenty-one kiln Trucks, 6 feet long, with 7" wheels, used for a cross piling kiln. (Please try to get steel wheels, instead of malleable wheels, if possible.)
6. Two more Recording Thermometers.
7. Four Mason Form Hygrometers.
8. One 14-foot diameter Turntable.
9. One Lumber Lift for a lift of ten feet, to carry a load of 20,000 pounds.
This is all I can think of right now, but, if you bring these, I know you will make me more happy than you could in any other way.
Very respectfully,
D. K. Operator.
P. S. Please don't forget the automatic controls.

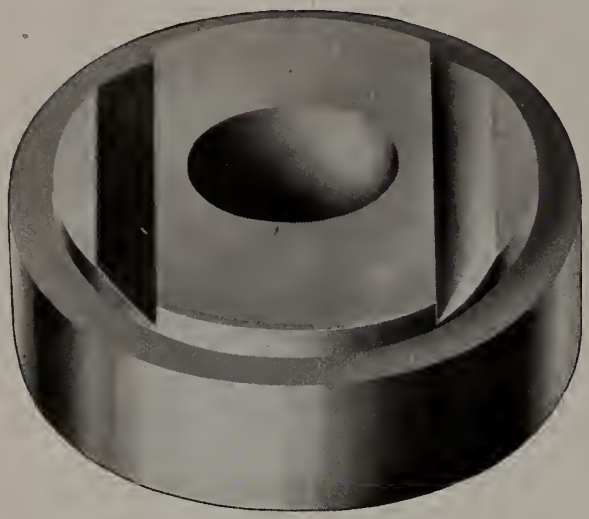
THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use



Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

THE
Brantford Pattern Works
BRANTFORD

The Door Carrier System

Makes your dry-kiln doors steam-tight and saves time, heat, trouble and money.

Carrier lifts door clear of kiln and carries it down track. Returning, deposits door to rabbeted joint, where it is held steam-tight by its own weight. Applicable to old or new kilns.

Ask for catalogue.

MECHANICAL LEATHER SPECIALTIES CO.
126 Garden Ave. Phone Park. 3105 Toronto

Save Wasted Steps

Out in the shop your men are constantly walking to the big jointer and back again; to the large saw and back once more—all day long, day after day, year in and year out. Wasted steps, wasted energy, wasted time; it's like walking on your bank. roll

adopt the WALLACE IDEA at every bench

Put a stop to this waste in time and energy by making it possible to do a great amount of this work right at the work-bench where the workman belongs.

Master craftsmen the nation over endorse Wallace Bench Planers, Jointers and Saws without reservation as the unique, time-saving systems of the age.

Consult your own machinery dealer or write us for complete information.

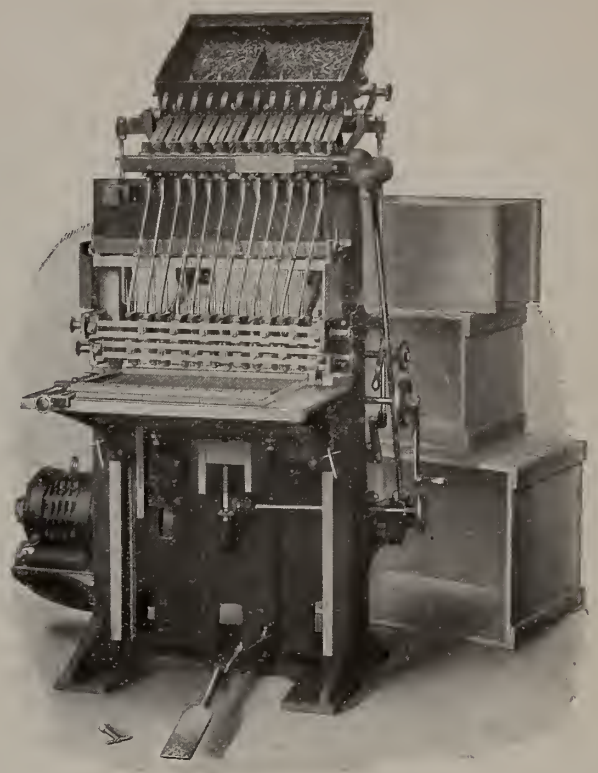
How do YOU Drive Nails?

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

Cleanliness Promotes Health

Remove the danger of scalding or shock from too hot or too cold water—see if your men don't use the showers and wash sinks more.

Greater cleanliness means better health — and the better a man's health the better his work.

The Powers Steam and Water Mixer mixes live steam and cold water, and saves double piping and double valves. Set it to deliver water of the desired temperature, and one faucet in each basin will do all the work.

Positive in action—never fails. Absolutely safe against scalding.

Rub Your Varnish Electrically

with a

MATTISON ELECTRIC Rubbing Machine

—operates direct from a lamp socket

By doing the work of two hand rubbers, the Mattison Electric cuts wages 50%, thus paying for itself many times over every year. It is a power unit complete in itself, consumes very little current, and requires no special hose or piping.

Any flat varnished surface, larger than the machine itself can be rubbed to better advantage with this portable electric rubber than by any other method.

The machine is very easy to handle, and relieves the operator of all the hard labor of hand rubbing. His attention is concentrated on his work; and with the machine he produces a finish much more uniform than is possible by hand.

Ask for bulletin "165" and get detailed information
